OVERVIEW

1.1 Introduction to Python scripting in Metashape Professional

This API is in development and will be extended in the future Metashape releases.

Note: Python scripting is supported only in Metashape Professional edition.

Metashape Professional uses Python 3.8 as a scripting engine.

Python commands and scripts can be executed in Metashape in one of the following ways:

- From Metashape "Console" pane using it as standard Python console.
- From the "Tools" menu using "Run script..." command.
- From command line using "-r" argument and passing the path to the script as an argument.

The following Metashape funtionality can be accessed from Python scripts:

- Open/save/create Metashape projects.
- Add/remove chunks, cameras, markers.
- Add/modify camera calibrations, ground control data, assign geographic projections and coordinates.
- Perform processing steps (align photos, build dense cloud, build mesh, texture, decimate model, etc...).
- Export processing results (models, textures, orthophotos, DEMs).
- Access data of generated models, point clouds, images.
- Start and control network processing tasks.

APPLICATION MODULES

Metashape module provides access to the core processing functionality, including support for inspection and manipulation with project data.

The main component of the module is a Document class, which represents a Metashape project. Multiple Document instances can be created simultaneously if needed. Besides that a currently opened project in the application can be accessed using Metashape.app.document property.

The following example performs main processing steps on existing project and saves back the results:

```
>>> import Metashape
>>> doc = Metashape.app.document
>>> doc.open("project.psz")
>>> chunk = doc.chunk
>>> chunk.matchPhotos(downscale=1, generic_preselection=True, reference_
↪preselection=False)
>>> chunk.alignCameras()
>>> chunk.buildDepthMaps(downscale=4, filter_mode=Metashape.AggressiveFiltering)
>>> chunk.buildModel(source_data=Metashape.DepthMapsData, surface_type=Metashape.
↪Arbitrary, interpolation=Metashape.EnabledInterpolation)
>>> chunk.buildUV(mapping_mode=Metashape.GenericMapping)
>>> chunk.buildTexture(blending_mode=Metashape.MosaicBlending, texture_size=4096)
>>> doc.save()
```

class `Metashape.`**`Antenna`**

> GPS antenna position relative to camera.
>
> **`copy()`**
>
> > Return a copy of the object.
> >
> > > **Returns**
> > > > A copy of the object.
> > >
> > > **Return type**
> > > > *Metashape.Antenna*
>
> **`fixed`**
>
> > Fix antenna flag.
> >
> > > **Type**
> > > > bool
>
> **`location`**
>
> > Antenna coordinates.

> **Type**
> *Metashape.Vector*

location_acc
>
> Antenna location accuracy.
>
> > **Type**
> > *Metashape.Vector*

location_covariance
>
> Antenna location covariance.
>
> > **Type**
> > *Metashape.Matrix*

location_ref
>
> Antenna location reference.
>
> > **Type**
> > *Metashape.Vector*

rotation
>
> Antenna rotation angles.
>
> > **Type**
> > *Metashape.Vector*

rotation_acc
>
> Antenna rotation accuracy.
>
> > **Type**
> > *Metashape.Vector*

rotation_covariance
>
> Antenna rotation covariance.
>
> > **Type**
> > *Metashape.Matrix*

rotation_ref
>
> Antenna rotation reference.
>
> > **Type**
> > *Metashape.Vector*

class `Metashape.`**`Application`**

> Application class provides access to several global application attributes, such as document currently loaded in the user interface, software version and GPU device configuration. It also contains helper routines to prompt the user to input various types of parameters, like displaying a file selection dialog or coordinate system selection dialog among others.
>
> An instance of Application object can be accessed using Metashape.app attribute, so there is usually no need to create additional instances in the user code.
>
> The following example prompts the user to select a new coordinate system, applies it to the ative chunk and saves the project under the user selected file name:

```
>>> import Metashape
>>> doc = Metashape.app.document
>>> crs = Metashape.app.getCoordinateSystem("Select Coordinate System", doc.chunk.
```

```
→crs)
>>> doc.chunk.crs = crs
>>> path = Metashape.app.getSaveFileName("Save Project As")
>>> try:
...     doc.save(path)
... except RuntimeError:
...     Metashape.app.messageBox("Can't save project")
```

class ConsolePane

ConsolePane class provides access to the console pane

> **clear()**
>
> > Clear console pane.
>
> **contents**
>
> > Console pane contents.
> > > **Type**
> > > > str

class ModelView

ModelView class provides access to the model view

> **class ModelViewMode**
>
> > Model view mode in [ModelViewTextured, ModelViewShaded, ModelViewSolid, ModelViewWire-frame, ModelViewElevation, ModelViewConfidence]
>
> **class PointCloudViewMode**
>
> > Point cloud view mode in [PointCloudViewSolid, PointCloudViewColor, PointCloudViewClassification, PointCloudViewIntensity, PointCloudViewElevation, PointCloudViewConfidence, PointCloudViewReturnNumber, PointCloudViewScanAngle, PointCloudViewSourceId]
>
> **class TiePointsViewMode**
>
> > Tie points view mode in [TiePointsViewColor, TiePointsViewElevation, TiePointsViewVariance]
>
> **class TiledModelViewMode**
>
> > Tiled model view mode in [TiledModelViewTextured, TiledModelViewSolid, TiledModelViewWire-frame, TiledModelViewElevation]
>
> **captureVideo**(*path*, *width*, *height*[, *frame_rate*][, *transparent*][, *compressed*][, *hide_items*])
>
> > Capture video using camera track. Transparent capture can't be compressed.Method requires gui and inaccessible from python module. If script is passed as a program argument, –gui flag should be specified.
> >
> > > **Parameters**
> > > - **path** (*str:arg width: Video width.*) – Output path.
> > > - **height** (*int*) – Video height.
> > > - **frame_rate** (*int*) – Video frame rate.
> > > - **transparent** (*bool*) – Sets transparent background.
> > > - **compressed** (*bool*) – Enables video compression.
> > > - **hide_items** (*bool*) – Hides all items.
>
> **captureView**([*width*][, *height*][, *transparent*][, *hide_items*])
>
> > Capture image from model view.
> >
> > > **Parameters**
> > > - **width** (*int*) – Image width.
> > > - **height** (*int*) – Image height.
```

> - **transparent** (`bool`) – Sets transparent background.
> - **hide_items** (`bool`) – Hides all items.
>> **Returns**
>>> Captured image.
>> **Return type**
>>> *[Metashape.Image](#)*

**model_view_mode**

> Model view mode.
>> **Type**
>>> *[Metashape.Application.ModelView.ModelViewMode](#)*

**point_cloud_view_mode**

> Point cloud view mode.
>> **Type**
>>> *[Metashape.Application.ModelView.PointCloudViewMode](#)*

**texture_view_mode**

> Texture view mode.
>> **Type**
>>> *[Metashape.Model.TextureType](#)*

**tie_points_view_mode**

> Tie points view mode.
>> **Type**
>>> *[Metashape.Application.ModelView.TiePointsViewMode](#)*

**tiled_model_view_mode**

> Tiled model view mode.
>> **Type**
>>> *[Metashape.Application.ModelView.TiledModelViewMode](#)*

**view_mode**

> View mode.
>> **Type**
>>> *[Metashape.DataSource](#)*

**viewpoint**

> Viewpoint in the model view.
>> **Type**
>>> *[Metashape.Viewpoint](#)*

**class OrthoView**

> OrthoView class provides access to the ortho view

> **captureView**([*width* ][, *height* ][, *transparent* ][, *hide_items* ])

>> Capture image from ortho view.
>>> **Parameters**
>>> - **width** (`int`) – Image width.
>>> - **height** (`int`) – Image height.
>>> - **transparent** (`bool`) – Sets transparent background.
>>> - **hide_items** (`bool`) – Hides all items.
>>> **Returns**
>>>> Captured image.
>>> **Return type**
>>>> *[Metashape.Image](#)*

**view_mode**

> View mode.
> > **Type**
> > *Metashape.DataSource*

**class PhotosPane**

> PhotosPane class provides access to the photos pane
>
> **resetFilter()**
>
> > Reset photos pane filter.
>
> **setFilter**(*items*)
>
> > Set photos pane filter.
> > > **Parameters**
> > > **items** (*list[Metashape.Camera | Metashape.Marker]*) – filter to apply.

**class Settings**

> PySettings()
>
> Application settings
>
> **language**
>
> > User interface language.
> > > **Type**
> > > str
>
> **load()**
>
> > Load settings from disk.
>
> **log_enable**
>
> > Enable writing log to file.
> > > **Type**
> > > bool
>
> **log_path**
>
> > Log file path.
> > > **Type**
> > > str
>
> **network_enable**
>
> > Network processing enabled flag.
> > > **Type**
> > > bool
>
> **network_host**
>
> > Network server host name.
> > > **Type**
> > > str
>
> **network_path**
>
> > Network data root path.
> > > **Type**
> > > str
>
> **network_port**
>
> > Network server control port.
> > > **Type**
> > > int

**project_absolute_paths**

>   Store absolute image paths in project files.
>
>>   **Type**
>>       bool

**project_compression**

>   Project compression level.
>
>>   **Type**
>>       int

**save()**

>   Save settings on disk.

**setValue**(*key*, *value*)

>   Set settings value.
>
>>   **Parameters**
>>
>>   - **key** (`str`) – Key.
>>   - **value** (`object`) – Value.

**value**(*key*)

>   Return settings value.
>
>>   **Parameters**
>>       **key** (`str`) – Key.
>>   **Returns**
>>       Settings value.
>>   **Return type**
>>       object

**activated**

>   Metashape activation status.
>
>>   **Type**
>>       bool

**addMenuItem**(*label*, *func* [, *shortcut* ] [, *icon* ])

>   Create a new menu entry.
>
>>   **Parameters**
>>
>>   - **label** (`str`) – Menu item label.
>>
>>   - **func** (`function`) – Function to be called.
>>
>>   - **shortcut** (`str`) – Keyboard shortcut.
>>
>>   - **icon** (`str`) – Icon.

**addMenuSeparator**(*label*)

>   Add menu separator.
>
>>   **Parameters**
>>       **label** (`str`) – Menu label.

**console_pane**

>   Console pane.
>
>>   **Type**
>>       *Metashape.Application.ConsolePane*

**cpu_enable**

Use CPU when GPU is active.

> **Type**
>> bool

**document**

Main application document object.

> **Type**
>> *Metashape.Document*

**enumGPUDevices()**

Enumerate installed GPU devices.

> **Returns**
>> A list of devices.

> **Return type**
>> list

**getBool**(*label=''*)

Prompt user for the boolean value.

> **Parameters**
>> **label** (*str*) – Optional text label for the dialog.

> **Returns**
>> Boolean value selected by the user.

> **Return type**
>> bool

**getCoordinateSystem**([*label*][, *value*])

Prompt user for coordinate system.

> **Parameters**
>> - **label** (*str*) – Optional text label for the dialog.
>> - **value** (Metashape.CoordinateSystem) – Default value.

> **Returns**
>> Selected coordinate system. If the dialog was cancelled, None is returned.

> **Return type**
>> *Metashape.CoordinateSystem*

**getExistingDirectory**([*hint*][, *dir*])

Prompt user for the existing folder.

> **Parameters**
>> - **hint** (*str*) – Optional text label for the dialog.
>> - **dir** (*str*) – Optional default folder.

> **Returns**
>> Path to the folder selected. If the input was cancelled, empty string is returned.

> **Return type**
>> str

**getFloat**(*label='', value=0*)

> Prompt user for the floating point value.

> > **Parameters**
> >
> > > • **label** (*str*) – Optional text label for the dialog.
> > >
> > > • **value** (*float*) – Default value.
> >
> > **Returns**
> > Floating point value entered by the user.
> >
> > **Return type**
> > float

**getInt**(*label='', value=0*)

> Prompt user for the integer value.

> > **Parameters**
> >
> > > • **label** (*str*) – Optional text label for the dialog.
> > >
> > > • **value** (*int*) – Default value.
> >
> > **Returns**
> > Integer value entered by the user.
> >
> > **Return type**
> > int

**getOpenFileName**([*hint*][, *dir*][, *filter*])

> Prompt user for the existing file.

> > **Parameters**
> >
> > > • **hint** (*str*) – Optional text label for the dialog.
> > >
> > > • **dir** (*str*) – Optional default folder.
> > >
> > > • **filter** (*str*) – Optional file filter, e.g. "Text file (*.txt)" or ".txt". Multiple filters are separated with ";;".
> >
> > **Returns**
> > Path to the file selected. If the input was cancelled, empty string is returned.
> >
> > **Return type**
> > str

**getOpenFileNames**([*hint*][, *dir*][, *filter*])

> Prompt user for one or more existing files.

> > **Parameters**
> >
> > > • **hint** (*str*) – Optional text label for the dialog.
> > >
> > > • **dir** (*str*) – Optional default folder.
> > >
> > > • **filter** (*str*) – Optional file filter, e.g. "Text file (*.txt)" or ".txt". Multiple filters are separated with ";;".
> >
> > **Returns**
> > List of file paths selected by the user. If the input was cancelled, empty list is returned.
> >
> > **Return type**
> > list

**getSaveFileName**([*hint* ][, *dir* ][, *filter* ])

Prompt user for the file. The file does not have to exist.

> **Parameters**
>
> - **hint** (*str*) – Optional text label for the dialog.
>
> - **dir** (*str*) – Optional default folder.
>
> - **filter** (*str*) – Optional file filter, e.g. *"Text file (.txt)" or "*.txt"*. Multiple filters are separated with ";;".
>
> **Returns**
>
> Path to the file selected. If the input was cancelled, empty string is returned.
>
> **Return type**
>
> str

**getString**(*label=''*, *value=''*)

Prompt user for the string value.

> **Parameters**
>
> - **label** (*str*) – Optional text label for the dialog.
>
> - **value** (*str*) – Default value.
>
> **Returns**
>
> String entered by the user.
>
> **Return type**
>
> str

**gpu_mask**

GPU device bit mask: 1 - use device, 0 - do not use (i.e. value 5 enables device number 0 and 2).

> **Type**
>
> int

**messageBox**(*message*)

Display message box to the user.

> **Parameters**
>
> **message** (*str*) – Text message to be displayed.

**model_view**

Model view.

> **Type**
>
> *[Metashape.Application.ModelView](#)*

**ortho_view**

Ortho view.

> **Type**
>
> *[Metashape.Application.OrthoView](#)*

**photos_pane**

Photos pane.

> **Type**
>
> *[Metashape.Application.PhotosPane](#)*

**quit**()

Exit application.

**releaseFreeMemory**()

Call malloc_trim on Linux (does nothing on other OS).

**removeMenuItem**(*label*)

Remove menu entry with given label (if exists). If there are multiple entries with given label - all of them will be removed.

> **Parameters**
>> **label** (*str*) – Menu item label.

**settings**

Application settings.

> **Type**
>> *Metashape.Application.Settings*

**title**

Application name.

> **Type**
>> str

**update**()

Update user interface during long operations.

**version**

Metashape version.

> **Type**
>> str

**class** Metashape.**AttachedGeometry**

Attached geometry data.

**GeometryCollection**(*geometries*)

Create a GeometryCollection geometry.

> **Parameters**
>> **geometries** (*list[*Metashape.AttachedGeometry*]*) – Child geometries.

> **Returns**
>> A GeometryCollection geometry.

> **Return type**
>> *Metashape.AttachedGeometry*

**LineString**(*coordinates*)

Create a LineString geometry.

> **Parameters**
>> **coordinates** (*list[int]*) – List of vertex coordinates.

> **Returns**
>> A LineString geometry.

> **Return type**
>> *Metashape.AttachedGeometry*

**MultiLineString**(*geometries*)

    Create a MultiLineString geometry.

        **Parameters**

            **geometries** (*list[*`Metashape.AttachedGeometry`*]*) – Child line strings.

        **Returns**

            A point geometry.

        **Return type**

            *[Metashape.AttachedGeometry](#)*

**MultiPoint**(*geometries*)

    Create a MultiPoint geometry.

        **Parameters**

            **geometries** (*list[*`Metashape.AttachedGeometry`*]*) – Child points.

        **Returns**

            A point geometry.

        **Return type**

            *[Metashape.AttachedGeometry](#)*

**MultiPolygon**(*geometries*)

    Create a MultiPolygon geometry.

        **Parameters**

            **geometries** (*list[*`Metashape.AttachedGeometry`*]*) – Child polygons.

        **Returns**

            A point geometry.

        **Return type**

            *[Metashape.AttachedGeometry](#)*

**Point**(*key*)

    Create a Point geometry.

        **Parameters**

            **key** (*int*) – Point marker key.

        **Returns**

            A point geometry.

        **Return type**

            *[Metashape.AttachedGeometry](#)*

**Polygon**(*exterior_ring*[, *interior_rings* ])

    Create a Polygon geometry.

        **Parameters**

            • **exterior_ring** (*list[int]*) – Point coordinates.

            • **interior_rings** (*list[int]*) – Point coordinates.

        **Returns**

            A Polygon geometry.

        **Return type**

            *[Metashape.AttachedGeometry](#)*

**coordinates**

> List of vertex keys.
>
> > **Type**
> >
> > > list[int]

**geometries**

> List of child geometries.
>
> > **Type**
> >
> > > list[*Metashape.AttachedGeometry*]

**type**

> Geometry type.
>
> > **Type**
> >
> > > *Metashape.Geometry.Type*

**class** Metashape.**BBox**

> Axis aligned bounding box
>
> **copy()**
>
> > Return a copy of the object.
> >
> > > **Returns**
> > >
> > > > A copy of the object.
> > >
> > > **Return type**
> > >
> > > > *Metashape.BBox*
>
> **max**
>
> > Maximum bounding box extent.
> >
> > > **Type**
> > >
> > > > *Metashape.Vector*
>
> **min**
>
> > Minimum bounding box extent.
> >
> > > **Type**
> > >
> > > > *Metashape.Vector*
>
> **size**
>
> > Bounding box dimension.
> >
> > > **Type**
> > >
> > > > int

**class** Metashape.**BlendingMode**

> Blending mode in [AverageBlending, MosaicBlending, MinBlending, MaxBlending, DisabledBlending]

**class** Metashape.**Calibration**

> Calibration object contains camera calibration information including image size, focal length, principal point coordinates and distortion coefficients.
>
> **b1**
>
> > Affinity.
> >
> > > **Type**
> > >
> > > > float

**b2**

    Non-orthogonality.

> **Type**
>
>     float

**copy()**

    Return a copy of the object.

> **Returns**
>
>     A copy of the object.
>
> **Return type**
>
>     *[Metashape.Calibration](#)*

**covariance_matrix**

    Covariance matrix.

> **Type**
>
>     *[Metashape.Matrix](#)*

**covariance_params**

    Covariance matrix parameters.

> **Type**
>
>     list[str]

**cx**

    Principal point X coordinate.

> **Type**
>
>     float

**cy**

    Principal point Y coordinate.

> **Type**
>
>     float

**error**(*point*, *proj*)

    Return projection error.

> **Parameters**
>
> - **point** (`Metashape.Vector`) – Coordinates of the point to be projected.
> - **proj** (`Metashape.Vector`) – Pixel coordinates of the point.
>
> **Returns**
>
>     2D projection error.
>
> **Return type**
>
>     *[Metashape.Vector](#)*

**f**

    Focal length.

> **Type**
>
>     float

**height**
Image height.

> **Type**
> int

**k1**
Radial distortion coefficient K1.

> **Type**
> float

**k2**
Radial distortion coefficient K2.

> **Type**
> float

**k3**
Radial distortion coefficient K3.

> **Type**
> float

**k4**
Radial distortion coefficient K4.

> **Type**
> float

**load**(*path*, *format=CalibrationFormatXML*)
Loads calibration from file.

> **Parameters**
> - **path** (*str*) – path to calibration file
> - **format** ([Metashape.CalibrationFormat](#)) – Calibration format.

**p1**
Decentering distortion coefficient P1.

> **Type**
> float

**p2**
Decentering distortion coefficiant P2.

> **Type**
> float

**p3**
Decentering distortion coefficient P3.

> **Type**
> float

**p4**
Decentering distortion coefficiant P4.

> **Type**
> float

**project**(*point*)

Return projected pixel coordinates of the point.

> **Parameters**
> **point** (`Metashape.Vector`) – Coordinates of the point to be projected.
>
> **Returns**
> 2D projected point coordinates.
>
> **Return type**
> *Metashape.Vector*

**rpc**

RPC model.

> **Type**
> *Metashape.RPCModel*

**save**(*path*, *format=CalibrationFormatXML*[, *label* ][, *pixel_size* ][, *focal_length* ], *cx = 0*, *cy = 0*)

Saves calibration to file.

> **Parameters**
>
> - **path** (`str`) – path to calibration file
>
> - **format** (`Metashape.CalibrationFormat`) – Calibration format.
>
> - **label** (`str`) – Calibration label used in Australis, CalibCam and CalCam formats.
>
> - **pixel_size** (`Metashape.Vector`) – Pixel size in mm used to convert normalized calibration coefficients to Australis and CalibCam coefficients.
>
> - **focal_length** (`float`) – Focal length (Grid calibration format only).
>
> - **cx** (`float`) – X principal point coordinate (Grid calibration format only).
>
> - **cy** (`float`) – Y principal point coordinate (Grid calibration format only).

**type**

Camera model.

> **Type**
> *Metashape.Sensor.Type*

**unproject**(*point*)

Return direction corresponding to the image point.

> **Parameters**
> **point** (`Metashape.Vector`) – Pixel coordinates of the point.
>
> **Returns**
> 3D vector in the camera coordinate system.
>
> **Return type**
> *Metashape.Vector*

**width**

Image width.

> **Type**
> int

**class** Metashape.`CalibrationFormat`

> Calibration format in [CalibrationFormatXML, CalibrationFormatAustralis, CalibrationFormatAustralisV7, CalibrationFormatPhotoModeler, CalibrationFormatCalibCam, CalibrationFormatCalCam, CalibrationFormatInpho, CalibrationFormatUSGS, CalibrationFormatPix4D, CalibrationFormatOpenCV, CalibrationFormatPhotomod, CalibrationFormatGrid, CalibrationFormatSTMap]

**class** Metashape.`Camera`

> Camera instance

```
>>> import Metashape
>>> chunk = Metashape.app.document.addChunk()
>>> chunk.addPhotos(["IMG_0001.jpg", "IMG_0002.jpg"])
>>> camera = chunk.cameras[0]
>>> camera.photo.meta["Exif/FocalLength"]
'18'
```

> The following example describes how to create multispectal camera layout:

```
>>> import Metashape
>>> doc = Metashape.app.document
>>> chunk = doc.chunk
>>> rgb = ["RGB_0001.JPG", "RGB_0002.JPG", "RGB_0003.JPG"]
>>> nir = ["NIR_0001.JPG", "NIR_0002.JPG", "NIR_0003.JPG"]
>>> images = [rgb[0], nir[0], rgb[1], nir[1], rgb[2], nir[2]]
>>> groups = [2, 2, 2]
>>> chunk.addPhotos(filenames=images, filegroups=groups, layout=Metashape.
↪MultiplaneLayout)
```

> **class Reference**

rotation

Camera rotation angles.
> **Type**
> *[Metashape.Vector](#)*

rotation_accuracy

Camera rotation accuracy.
> **Type**
> *[Metashape.Vector](#)*

rotation_enabled

Rotation enabled flag.
> **Type**
> bool

class Type

Camera type in [Regular, Keyframe]

calibration

Adjusted camera calibration including photo-invariant parameters.

> **Type**
> *[Metashape.Calibration](#)*

center

Camera station coordinates for the photo in the chunk coordinate system.

> **Type**
> *[Metashape.Vector](#)*

chunk

Chunk the camera belongs to.

> **Type**
> *[Metashape.Chunk](#)*

component

Camera component.

> **Type**
> *[Metashape.Component](#)*

enabled

Enables/disables the photo.

> **Type**
> bool

error(*point*, *proj*)

Returns projection error.

> **Parameters**
>
> - **point** (`Metashape.Vector`) – Coordinates of the point to be projected.
>
> - **proj** (`Metashape.Vector`) – Pixel coordinates of the point.
>
> **Returns**
> 2D projection error.

> **Return type**
> *Metashape.Vector*

frames
> Camera frames.
>
> > **Type**

meta

Camera meta data.

> **Type**
>> *Metashape.MetaData*

open(*path*[, *layer*])

Loads specified image file.

> **Parameters**
>> - **path** (*str*) – Path to the image file to be loaded.
>>
>> - **layer** (*int*) – Optional layer index in case of multipage files.

orientation

Image orientation (1 - normal, 6 - 90 degree, 3 - 180 degree, 8 - 270 degree).

> **Type**
>> int

photo

Camera photo.

> **Type**
>> *Metashape.Photo*

planes

Camera planes.

> **Type**
>> list[*Metashape.Camera*]

project(*point*)

Returns coordinates of the point projection on the photo.

> **Parameters**
>> **point** (Metashape.Vector) – Coordinates of the point to be projected.

> **Returns**
>> 2D point coordinates.

> **Return type**
>> *Metashape.Vector*

reference

Camera reference data.

> **Type**
>> *Metashape.Camera.Reference*

rotation_covariance

Camera rotation covariance.

> **Type**
>> *Metashape.Matrix*

selected

Selects/deselects the photo.

> **Type**
>> bool

sensor

Camera sensor.

> **Type**
> *Metashape.Sensor*

shutter

Camera shutter.

> **Type**
> *Metashape.Shutter*

thumbnail

Camera thumbnail.

> **Type**
> *Metashape.Thumbnail*

transform

4x4 matrix describing photo location in the chunk coordinate system.

> **Type**
> *Metashape.Matrix*

type

Camera type.

> **Type**
> *Metashape.Camera.Type*

unproject(*point*)

Returns coordinates of the point which will have specified projected coordinates.

> **Parameters**
> **point** (`Metashape.Vector`) – Projection coordinates.
>
> **Returns**
> 3D point coordinates.
>
> **Return type**
> *Metashape.Vector*

vignetting

Vignetting for each band.

> **Type**
> list[*Metashape.Vignetting*]

class `Metashape.CameraGroup`

CameraGroup objects define groups of multiple cameras. The grouping is established by assignment of a CameraGroup instance to the Camera.group attribute of participating cameras.

The type attribute of CameraGroup instances defines the effect of such grouping on processing results and can be set to Folder (no effect) or Station (coincident projection centers).

class Type

Camera group type in [Folder, Station]

key

Camera group identifier.

> > - **max_waypoints** (`int`) – Max waypoints per flight
> >
> > - **projection** ([`Metashape.CoordinateSystem`](#)) – Camera track coordinate system.

smooth

> Smooth path.

> > **Type**
> >
> > > bool

class Metashape.`CamerasFormat`

Camera orientation format in [CamerasFormatXML, CamerasFormatCHAN, CamerasFormatBoujou, CamerasFormatBundler, CamerasFormatOPK, CamerasFormatPATB, CamerasFormatBINGO, CamerasFormatORIMA, CamerasFormatAeroSys, CamerasFormatInpho, CamerasFormatSummit, CamerasFormatBlocksExchange, CamerasFormatRZML, CamerasFormatVisionMap, CamerasFormatABC, CamerasFormatFBX, CamerasFormatNVM, CamerasFormatMA]

class Metashape.`Chunk`

A Chunk object:

- provides access to all chunk components (sensors, cameras, camera groups, markers, scale bars)

- contains data inherent to individual frames (tie points, model, etc)

- implements processing methods (matchPhotos, alignCameras, buildPointCloud, buildModel, etc)

- provides access to other chunk attributes (transformation matrix, coordinate system, meta-data, etc..)

New components can be created using corresponding addXXX methods (addSensor, addCamera, addCameraGroup, addMarker, addScalebar, addFrame). Removal of components is supported by a single remove method, which can accept lists of various component types.

In case of multi-frame chunks the Chunk object contains an additional reference to the particular chunk frame, initialized to the current frame by default. Various methods that work on a per frame basis (matchPhotos, buildModel, etc) are applied to this particular frame. A frames attribute can be used to obtain a list of Chunk objects that reference all available frames.

The following example performs image matching and alignment for the active chunk:

```
>>> import Metashape
>>> chunk = Metashape.app.document.chunk
>>> for frame in chunk.frames:
...     frame.matchPhotos(downscale=1)
>>> chunk.alignCameras()
```

`addCamera`([*sensor*])

Add new camera to the chunk.

> **Parameters**
> **sensor** (`Metashape.Sensor`) – Sensor to be assigned to this camera.

> **Returns**
> Created camera.

> **Return type**
> *Metashape.Camera*

`addCameraGroup`()

Add new camera group to the chunk.

> **Returns**
> Created camera group.

> **Return type**
> *Metashape.CameraGroup*

`addCameraTrack`()

Add new camera track to the chunk.

> **Returns**
> Created camera track.

> > > **Return type**
> > > *[Metashape.CameraTrack](#)*

> > **addDepthMaps()**
> > Add new depth maps set to the chunk.

> > > **Returns**
> > > Created depth maps set.

> > > **Return type**
> > > *[Metashape.DepthMaps](#)*

> > **addElevation()**
> > Add new elevation model to the chunk.

> > > **Returns**
> > > Created elevation model.

> > > **Return type**
> > > *[Metashape.Elevation](#)*

> > **addFrame()**
> > Add new frame to the chunk.

> > > **Returns**
> > > Created frame.

> > > **Return type**
> > > *[Metashape.Chunk](#)*

> **addFrames**([*chunk*][, *frames*], *copy_depth_maps=True*, *copy_point_cloud=True*, *copy_model=True*, *copy_tiled_model=True*, *copy_elevation=True*, *copy_orthomosaic=True*[, *progress*])
> > Add frames from specified chunk.

> > > **Parameters**
> > > - **chunk** (`int`) – Chunk to copy frames from.
> > > - **frames** (`list[int]`) – List of frame keys to copy.
> > > - **copy_depth_maps** (`bool`) – Copy depth maps.
> > > - **copy_point_cloud** (`bool`) – Copy point cloud.
> > > - **copy_model** (`bool`) – Copy model.
> > > - **copy_tiled_model** (`bool`) – Copy tiled model.
> > > - **copy_elevation** (`bool`) – Copy DEM.
> > > - **copy_orthomosaic** (`bool`) – Copy orthomosaic.
> > > - **progress** (`Callable[[float], None]`) – Progress callback.

> **addMarker**([*point*], *visibility=False*)
> > Add new marker to the chunk.

> > > **Parameters**
> > > - **point** ([`Metashape.Vector`](#)) – Point to initialize marker projections.
> > > - **visibility** (`bool`) – Enables visibility check during projection assignment.

> > > **Returns**
> > > Created marker.

> **Return type**
> *Metashape.Marker*

addMarkerGroup()

Add new marker group to the chunk.

> **Returns**
> Created marker group.
>
> **Return type**
> *Metashape.MarkerGroup*

addModel()

Add new model to the chunk.

> **Returns**
> Created model.
>
> **Return type**
> *Metashape.Model*

addOrthomosaic()

Add new orthomosaic to the chunk.

> **Returns**
> Created orthomosaic.
>
> **Return type**
> *Metashape.Orthomosaic*

addPhotos([*filenames*][, *filegroups*], *layout=UndefinedLayout*[, *group*], *strip_extensions=True*,
  load_reference=True, *load_xmp_calibration=True*, *load_xmp_orientation=True*,
  load_xmp_accuracy=False, *load_xmp_antenna=True*, *load_rpc_txt=False*[, *progress*])

Add a list of photos to the chunk.

> **Parameters**
>
> - **filenames** (`list[str]`) – List of files to add.
> - **filegroups** (`list[int]`) – List of file groups.
> - **layout** (`Metashape.ImageLayout`) – Image layout.
> - **group** (`int`) – Camera group key.
> - **strip_extensions** (`bool`) – Strip file extensions from camera labels.
> - **load_reference** (`bool`) – Load reference coordinates.
> - **load_xmp_calibration** (`bool`) – Load calibration from XMP meta data.
> - **load_xmp_orientation** (`bool`) – Load orientation from XMP meta data.
> - **load_xmp_accuracy** (`bool`) – Load accuracy from XMP meta data.
> - **load_xmp_antenna** (`bool`) – Load GPS/INS offset from XMP meta data.
> - **load_rpc_txt** (`bool`) – Load satellite RPC data from auxiliary TXT files.
> - **progress** (`Callable[[float], None]`) – Progress callback.

addPointCloud()

Add new point cloud to the chunk.

> **Returns**
>> Created point cloud.
>
> **Return type**
>> *Metashape.PointCloud*

addPointCloudGroup()
> Add new point cloud group to the chunk.
>
>> **Returns**
>>> Created point cloud group.
>>
>> **Return type**
>>> *Metashape.PointCloudGroup*

addScalebar(*point1*, *point2*)
> Add new scale bar to the chunk.
>
>> **Parameters**
>>
>> - **point1** (`Metashape.Marker` | `Metashape.Camera`) – First endpoint.
>>
>> - **point2** (`Metashape.Marker` | `Metashape.Camera`) – Second endpoint.
>>
>> **Returns**
>>> Created scale bar.
>>
>> **Return type**
>>> *Metashape.Scalebar*

addScalebarGroup()
> Add new scale bar group to the chunk.
>
>> **Returns**
>>> Created scale bar group.
>>
>> **Return type**
>>> *Metashape.ScalebarGroup*

addSensor([*source*])
> Add new sensor to the chunk.
>
>> **Parameters**
>>> **source** (`Metashape.Sensor`) – Sensor to copy parameters from.
>>
>> **Returns**
>>> Created sensor.
>>
>> **Return type**
>>> *Metashape.Sensor*

addTiledModel()
> Add new tiled model to the chunk.
>
>> **Returns**
>>> Created tiled model.
>>
>> **Return type**
>>> *Metashape.TiledModel*

alignCameras([*cameras*][, *point_clouds*], *min_image=2*, *adaptive_fitting=False*, *reset_alignment=False*, *subdivide_task=True*[, *progress*])
> Perform photo alignment for the chunk.

Parameters

- **cameras** (`list[int]`) – List of cameras to align.

- **point_clouds** (`list[int]`) – List of point clouds to align.

- **min_image** (`int`) – Minimum number of point projections.

- **adaptive_fitting** (`bool`) – Enable adaptive fitting of distortion coefficients.

- **reset_alignment** (`bool`) – Reset current alignment.

- **subdivide_task** (`bool`) – Enable fine-level task subdivision.

- **progress** (`Callable[[float], None]`) – Progress callback.

analyzeImages([*cameras*], *filter_mask=False*[, *progress*])

Estimate image quality. Estimated value is stored in camera metadata with Image/Quality key. Cameras with quality less than 0.5 are considered blurred and we recommend to disable them.

Parameters

- **cameras** (`list[int]`) – List of cameras to be analyzed.

- **filter_mask** (`bool`) – Constrain analyzed image region by mask.

- **progress** (`Callable[[float], None]`) – Progress callback.

buildContours(*source_data=ElevationData*, *interval=1*, *min_value=-1e+10*, *max_value=1e+10*, *prevent_intersections=True*[, *progress*])

Build contours for the chunk.

Parameters

- **source_data** (`Metashape.DataSource`) – Source data for contour generation.

- **interval** (`float`) – Contour interval.

- **min_value** (`float`) – Minimum value of contour range.

- **max_value** (`float`) – Maximum value of contour range.

- **prevent_intersections** (`bool`) – Prevent contour intersections.

- **progress** (`Callable[[float], None]`) – Progress callback.

buildDem(*source_data=PointCloudData*, *interpolation=EnabledInterpolation*[, *projection*][, *region*][, *classes*], *flip_x=False*, *flip_y=False*, *flip_z=False*, *resolution=0*, *subdivide_task=True*, *workitem_size_tiles=10*, *max_workgroup_size=100*, *replace_asset=False*[, *frames*][, *progress*])

Build elevation model for the chunk.

Parameters

- **source_data** (`Metashape.DataSource`) – Selects between point cloud and tie points.

- **interpolation** (`Metashape.Interpolation`) – Interpolation mode.

- **projection** (`Metashape.OrthoProjection`) – Output projection.

- **region** (`Metashape.BBox`) – Region to be processed.

- **classes** (`list[int]`) – List of point classes to be used for surface extraction.

- **flip_x** (`bool`) – Flip X axis direction.

- **flip_y** (`bool`) – Flip Y axis direction.

- **flip_z** (`bool`) – Flip Z axis direction.

- **resolution** (*float*) – Output resolution in meters.

- **subdivide_task** (*bool*) – Enable fine-level task subdivision.

- **workitem_size_tiles** (*int*) – Number of tiles in a workitem.

- **max_workgroup_size** (*int*) – Maximum workgroup size.

- **replace_asset** (*bool*) – Replace default asset with generated DEM.

- **frames** (*list[int]*) – List of frames to process.

- **progress** (*Callable[[float], None]*) – Progress callback.

buildDepthMaps(*downscale=4*, *filter_mode=MildFiltering*[, *cameras*], *reuse_depth=False*, *max_neighbors=16*, *subdivide_task=True*, *workitem_size_cameras=20*, *max_workgroup_size=100*[, *progress*])

Generate depth maps for the chunk.

> **Parameters**
>
> - **downscale** (*int*) – Depth map quality (1 - Ultra high, 2 - High, 4 - Medium, 8 - Low, 16 - Lowest).
>
> - **filter_mode** ([*Metashape.FilterMode*](#)) – Depth map filtering mode.
>
> - **cameras** (*list[int]*) – List of cameras to process.
>
> - **reuse_depth** (*bool*) – Enable reuse depth maps option.
>
> - **max_neighbors** (*int*) – Maximum number of neighbor images to use for depth map generation.
>
> - **subdivide_task** (*bool*) – Enable fine-level task subdivision.
>
> - **workitem_size_cameras** (*int*) – Number of cameras in a workitem.
>
> - **max_workgroup_size** (*int*) – Maximum workgroup size.
>
> - **progress** (*Callable[[float], None]*) – Progress callback.

buildModel(*surface_type=Arbitrary*, *interpolation=EnabledInterpolation*, *face_count=HighFaceCount*, *face_count_custom=200000*, *source_data=DepthMapsData*[, *classes*], *vertex_colors=True*, *vertex_confidence=True*, *volumetric_masks=False*, *keep_depth=True*, *replace_asset=False*, *split_in_blocks=False*[, *blocks_crs*], *blocks_size=250*[, *blocks_origin*], *clip_to_boundary=False*, *export_blocks=False*, *build_texture=True*, *output_folder=''*, *trimming_radius=10*[, *cameras*][, *frames*], *subdivide_task=True*, *workitem_size_cameras=20*, *max_workgroup_size=100*[, *progress*])

Generate model for the chunk frame.

> **Parameters**
>
> - **surface_type** ([*Metashape.SurfaceType*](#)) – Type of object to be reconstructed.
>
> - **interpolation** ([*Metashape.Interpolation*](#)) – Interpolation mode.
>
> - **face_count** ([*Metashape.FaceCount*](#)) – Target face count.
>
> - **face_count_custom** (*int*) – Custom face count.
>
> - **source_data** ([*Metashape.DataSource*](#)) – Selects between point cloud, tie points, depth maps and laser scans.
>
> - **classes** (*list[int]*) – List of point classes to be used for surface extraction.
>
> - **vertex_colors** (*bool*) – Enable vertex colors calculation.

- **vertex_confidence** (*bool*) – Enable vertex confidence calculation.

- **volumetric_masks** (*bool*) – Enable strict volumetric masking.

- **keep_depth** (*bool*) – Enable store depth maps option.

- **replace_asset** (*bool*) – Replace default asset with generated model.

- **split_in_blocks** (*bool*) – Split model in blocks.

- **blocks_crs** (Metashape.CoordinateSystem) – Blocks grid coordinate system.

- **blocks_size** (*float*) – Blocks size in coordinate system units.

- **blocks_origin** (Metashape.Vector) – Blocks grid origin.

- **clip_to_boundary** (*bool*) – Clip to boundary shapes.

- **export_blocks** (*bool*) – Export completed blocks.

- **build_texture** (*bool*) – Generate preview textures.

- **output_folder** (*str*) – Path to output folder.

- **trimming_radius** (*int*) – Trimming radius (no trimming if zero).

- **cameras** (*list[int]*) – List of cameras to process.

- **frames** (*list[int]*) – List of frames to process.

- **subdivide_task** (*bool*) – Enable fine-level task subdivision.

- **workitem_size_cameras** (*int*) – Number of cameras in a workitem.

- **max_workgroup_size** (*int*) – Maximum workgroup size.

- **progress** (*Callable[[float], None]*) – Progress callback.

buildOrthomosaic(*surface_data=ModelData*, *blending_mode=MosaicBlending*, *fill_holes=True*, *ghosting_filter=False*, *cull_faces=False*, *refine_seamlines=False*[, *projection*][, *region*], *resolution=0*, *resolution_x=0*, *resolution_y=0*, *flip_x=False*, *flip_y=False*, *flip_z=False*, *subdivide_task=True*, *workitem_size_cameras=20*, *workitem_size_tiles=10*, *max_workgroup_size=100*, *replace_asset=False*[, *frames*][, *progress*])

Build orthomosaic for the chunk.

Parameters

- **surface_data** (Metashape.DataSource) – Orthorectification surface.

- **blending_mode** (Metashape.BlendingMode) – Orthophoto blending mode.

- **fill_holes** (*bool*) – Enable hole filling.

- **ghosting_filter** (*bool*) – Enable ghosting filter.

- **cull_faces** (*bool*) – Enable back-face culling.

- **refine_seamlines** (*bool*) – Refine seamlines based on image content.

- **projection** (Metashape.OrthoProjection) – Output projection.

- **region** (Metashape.BBox) – Region to be processed.

- **resolution** (*float*) – Pixel size in meters.

- **resolution_x** (*float*) – Pixel size in the X dimension in projected units.

- **resolution_y** (*float*) – Pixel size in the Y dimension in projected units.

- **flip_x** (*bool*) – Flip X axis direction.

- **flip_y** (*bool*) – Flip Y axis direction.

- **flip_z** (*bool*) – Flip Z axis direction.

- **subdivide_task** (*bool*) – Enable fine-level task subdivision.

- **workitem_size_cameras** (*int*) – Number of cameras in a workitem.

- **workitem_size_tiles** (*int*) – Number of tiles in a workitem.

- **max_workgroup_size** (*int*) – Maximum workgroup size.

- **replace_asset** (*bool*) – Replace default asset with generated orthomosaic.

- **frames** (*list[int]*) – List of frames to process.

- **progress** (*Callable[[float], None]*) – Progress callback.

buildPanorama(*blending_mode=MosaicBlending*, *ghosting_filter=False*[, *rotation*][, *region*], *width=0*, *height=0*[, *camera_groups*][, *frames*][, *progress*])

Generate spherical panoramas from camera stations.

Parameters

- **blending_mode** ([*Metashape.BlendingMode*]) – Panorama blending mode.

- **ghosting_filter** (*bool*) – Enable ghosting filter.

- **rotation** ([*Metashape.Matrix*]) – Panorama 3x3 orientation matrix.

- **region** ([*Metashape.BBox*]) – Region to be generated.

- **width** (*int*) – Width of output panorama.

- **height** (*int*) – Height of output panorama.

- **camera_groups** (*list[int]*) – List of camera groups to process.

- **frames** (*list[int]*) – List of frames to process.

- **progress** (*Callable[[float], None]*) – Progress callback.

buildPointCloud(*source_data=DepthMapsData*, *point_colors=True*, *point_confidence=False*, *keep_depth=True*, *max_neighbors=100*, *uniform_sampling=True*, *points_spacing=0.1*[, *asset*], *subdivide_task=True*, *workitem_size_cameras=20*, *max_workgroup_size=100*, *replace_asset=False*[, *frames*][, *progress*])

Generate point cloud for the chunk.

Parameters

- **source_data** ([*Metashape.DataSource*]) – Source data to extract points from.

- **point_colors** (*bool*) – Enable point colors calculation.

- **point_confidence** (*bool*) – Enable point confidence calculation.

- **keep_depth** (*bool*) – Enable store depth maps option.

- **max_neighbors** (*int*) – Maximum number of neighbor images to use for depth map filtering.

- **uniform_sampling** (*bool*) – Enable uniform point sampling.

- **points_spacing** (*float*) – Desired point spacing (m).

- **asset** (*int*) – Asset to process.

- **subdivide_task** (*bool*) – Enable fine-level task subdivision.

- **workitem_size_cameras** (*int*) – Number of cameras in a workitem.

- **max_workgroup_size** (*int*) – Maximum workgroup size.

- **replace_asset** (*bool*) – Replace default asset with generated point cloud.

- **frames** (*list[int]*) – List of frames to process.

- **progress** (*Callable[[float], None]*) – Progress callback.

buildSeamlines(*epsilon=1.5*[, *progress*])

    Generate shapes for orthomosaic seamlines.

        Parameters

- **epsilon** (*float*) – Contour simplificaion threshold.

- **progress** (*Callable[[float], None]*) – Progress callback.

buildTexture(*blending_mode=MosaicBlending*, *texture_size=8192*, *fill_holes=True*, *ghosting_filter=True*[, *cameras*], *texture_type=DiffuseMap*[, *source_model*], *transfer_texture=True*, *workitem_size_cameras=20*, *max_workgroup_size=100*, *anti_aliasing=1*[, *progress*])

    Generate texture for the chunk.

        Parameters

- **blending_mode** (Metashape.BlendingMode) – Texture blending mode.

- **texture_size** (*int*) – Texture page size.

- **fill_holes** (*bool*) – Enable hole filling.

- **ghosting_filter** (*bool*) – Enable ghosting filter.

- **cameras** (*list[int]*) – A list of cameras to be used for texturing.

- **texture_type** (Metashape.Model.TextureType) – Texture type.

- **source_model** (*int*) – Source model.

- **transfer_texture** (*bool*) – Transfer texture.

- **workitem_size_cameras** (*int*) – Number of cameras in a workitem (block model only).

- **max_workgroup_size** (*int*) – Maximum workgroup size (block model only).

- **anti_aliasing** (*int*) – Anti-aliasing coefficient for baking

- **progress** (*Callable[[float], None]*) – Progress callback.

buildTiledModel(*pixel_size=0*, *tile_size=256*, *source_data=DepthMapsData*, *face_count=20000*, *ghosting_filter=False*, *transfer_texture=False*, *keep_depth=True*, *merge=False*[, *operand_chunk*][, *operand_frame*][, *operand_asset*][, *classes*], *subdivide_task=True*, *workitem_size_cameras=20*, *max_workgroup_size=100*, *replace_asset=False*[, *frames*][, *progress*])

    Build tiled model for the chunk.

        Parameters

- **pixel_size** (*float*) – Target model resolution in meters.

- **tile_size** (*int*) – Size of tiles in pixels.

- **source_data** (Metashape.DataSource) – Selects between point cloud and mesh.

- **face_count** (*int*) – Number of faces per megapixel of texture resolution.

- **ghosting_filter** (*bool*) – Enable ghosting filter.
- **transfer_texture** (*bool*) – Transfer source model texture to tiled model.
- **keep_depth** (*bool*) – Enable store depth maps option.
- **merge** (*bool*) – Merge tiled model flag.
- **operand_chunk** (*int*) – Operand chunk key.
- **operand_frame** (*int*) – Operand frame key.
- **operand_asset** (*int*) – Operand asset key.
- **classes** (*list[int]*) – List of point classes to be used for surface extraction.
- **subdivide_task** (*bool*) – Enable fine-level task subdivision.
- **workitem_size_cameras** (*int*) – Number of cameras in a workitem.
- **max_workgroup_size** (*int*) – Maximum workgroup size.
- **replace_asset** (*bool*) – Replace default asset with generated tiled model.
- **frames** (*list[int]*) – List of frames to process.
- **progress** (*Callable[[float], None]*) – Progress callback.

buildUV(*mapping_mode=GenericMapping*, *page_count=1*, *texture_size=8192*, *pixel_size=0*[, *camera*][, *progress*])

Generate uv mapping for the model.

Parameters

- **mapping_mode** ([Metashape.MappingMode](#)) – Texture mapping mode.
- **page_count** (*int*) – Number of texture pages to generate.
- **texture_size** (*int*) – Expected size of texture page at texture generation step.
- **pixel_size** (*float*) – Texture resolution in meters.
- **camera** (*int*) – Camera to be used for texturing in CameraMapping mode.
- **progress** (*Callable[[float], None]*) – Progress callback.

calculatePointNormals(*point_neighbors=28*[, *point_cloud*][, *progress*])

Calculate point cloud normals.

Parameters

- **point_neighbors** (*int*) – Number of point neighbors to use for normal estimation.
- **point_cloud** (*int*) – Point cloud key to process.
- **progress** (*Callable[[float], None]*) – Progress callback.

calibrateColors(*source_data=ModelData*, *white_balance=False*[, *cameras*][, *progress*])

Perform radiometric calibration.

Parameters

- **source_data** ([Metashape.DataSource](#)) – Source data for calibration.
- **white_balance** (*bool*) – Calibrate white balance.
- **cameras** (*list[int]*) – List of cameras to process.
- **progress** (*Callable[[float], None]*) – Progress callback.

calibrateReflectance(*use_reflectance_panels=True*, *use_sun_sensor=False*[, *progress*])

> Calibrate reflectance factors based on calibration panels and/or sun sensor.

> > **Parameters**

> > > • **use_reflectance_panels** (*bool*) – Use calibrated reflectance panels.

> > > • **use_sun_sensor** (*bool*) – Apply irradiance sensor measurements.

> > > • **progress** (*Callable[[float], None]*) – Progress callback.

camera_crs

> Coordinate system used for camera reference data.

> > **Type**

> > > *[Metashape.CoordinateSystem](#)*

camera_groups

> List of camera groups in the chunk.

> > **Type**

> > > list[*[Metashape.CameraGroup](#)*]

camera_location_accuracy

> Expected accuracy of camera coordinates in meters.

cir_transform

> CIR calibration matrix.

> > **Type**

> > > *[Metashape.CirTransform](#)*

colorizeModel(*source_data=ImagesData*[, *model*][, *progress*])

> Calculate vertex colors for the model.

> > **Parameters**

- **source_data** (`Metashape.DataSource`) – Source data to extract colors from.
- **model** (`int`) – Key of model to colorize.
- **progress** (`Callable[[float], None]`) – Progress callback.

colorizePointCloud(*source_data=ImagesData*, *workitem_size_cameras=20*, *max_workgroup_size=100*, *subdivide_task=True*[, *point_cloud*][, *progress*])

> Calculate point colors for the point cloud.

> > **Parameters**

> > - **source_data** (`Metashape.DataSource`) – Source data to extract colors from.
> > - **workitem_size_cameras** (`int`) – Number of cameras in a workitem.
> > - **max_workgroup_size** (`int`) – Maximum workgroup size.
> > - **subdivide_task** (`bool`) – Enable fine-level task subdivision.
> > - **point_cloud** (`int`) – Point cloud key to colorize.
> > - **progress** (`Callable[[float], None]`) – Progress callback.

component

> Component.

> > **Type**
> > *Metashape.Component*

components

> List of components in the chunk.

> > **Type**
> > list[*Metashape.Component*]

copy([*frames*][, *items*], *keypoints=True*[, *progress*])

> Make a copy of the chunk.

> > **Parameters**

> > - **frames** (`list[Metashape.Chunk]`) – Optional list of frames to be copied.
> > - **items** (`list[Metashape.DataSource]`) – A list of items to copy.
> > - **keypoints** (`bool`) – copy key points data.
> > - **progress** (`Callable[[float], None]`) – Progress callback.

> > **Returns**
> > Copy of the chunk.

> > **Return type**
> > *Metashape.Chunk*

crs

> > **Type**
> > *Metashape.CoordinateSystem*

decimateModel(*face_count=200000*[, *model*], *apply_to_selection=False*, *replace_asset=False*[, *frames*][, *progress*])

> Decimate the model to the specified face count.

> **Parameters**
>
> - **face_count** (*int*) – Target face count.
>
> - **model** (*int*) – Model to process.
>
> - **apply_to_selection** (*bool*) – Apply to selection.
>
> - **replace_asset** (*bool*) – Replace source model with decimated model.
>
> - **frames** (*list[int]*) – List of frames to process.
>
> - **progress** (*Callable[[float], None]*) – Progress callback.

depth_maps

> Default depth maps set for the current frame.
>
> > **Type**
> > *[Metashape.DepthMaps](#)*

depth_maps_sets

> List of depth maps sets for the current frame.
>
> > **Type**

> Detect fiducial marks on film cameras.
>
> > **Parameters**
> >
> > - **generate_masks** (*bool*) – Generate background masks.
> >
> > - **mask_dark_pixels** (*bool*) – Mask out dark pixels near frame edge.
> >
> > - **generic_detector** (*bool*) – Use generic detector.
> >
> > - **right_angle_detector** (*bool*) – Use right angle detector.
> >
> > - **v_shape_detector** (*bool*) – Detect V-shape fiducials.
> >
> > - **frame_detector** (*bool*) – Detect frame.
> >
> > - **fiducials_position_corners** (*bool*) – Search corners for fiducials.
> >
> > - **fiducials_position_sides** (*bool*) – Search sides for fiducials.
> >
> > - **cameras** (*list[int]*) – List of cameras to process.
> >
> > - **frames** (*list[int]*) – List of frames to process.
> >
> > - **progress** (*Callable[[float], None]*) – Progress callback.

detectMarkers(*target_type=CircularTarget12bit*, *tolerance=50*, *filter_mask=False*, *inverted=False*, *noparity=False*, *maximum_residual=5*, *minimum_size=0*, *minimum_dist=5*$\big[$, *cameras* $\big]\big[$, *frames* $\big]\big[$, *progress* $\big]$)

> Create markers from coded targets.
>
> > **Parameters**
> >
> > - **target_type** (*[Metashape.TargetType](#)*) – Type of targets.
> >
> > - **tolerance** (*int*) – Detector tolerance (0 - 100).

- **filter_mask** (*bool*) – Ignore masked image regions.
- **inverted** (*bool*) – Detect markers on black background.
- **noparity** (*bool*) – Disable parity checking.
- **maximum_residual** (*float*) – Maximum residual for non-coded targets in pixels.
- **minimum_size** (*int*) – Minimum target radius in pixels to be detected (CrossTarget type only).
- **minimum_dist** (*int*) – Minimum distance between targets in pixels (CrossTarget type only).
- **cameras** (*list[int]*) – List of cameras to process.
- **frames** (*list[int]*) – List of frames to process.
- **progress** (*Callable[[float], None]*) – Progress callback.

detectPowerlines(*min_altitude=1*, *n_points_per_line=100*, *max_quantization_error=0.01*, *use_model=True*[, *progress*])

Detect powerlines for the chunk.

> **Parameters**
>
> - **min_altitude** (*float*) – Minimum altitude for reconstructed powerlines.
> - **n_points_per_line** (*int*) – Maximum number of vertices per detected line.
> - **max_quantization_error** (*float*) – Maximum allowed distance between polyline and smooth continuous curve.
> - **use_model** (*bool*) – Use model for visibility checks.
> - **progress** (*Callable[[float], None]*) – Progress callback.

elevation

Default elevation model for the current frame.

> **Type**
> *Metashape.Elevation*

elevations

List of elevation models for the current frame.

> **Type**
> list[*Metashape.Elevation*]

enabled

Enables/disables the chunk.

> **Type**
> bool

euler_angles

Euler angles triplet used for rotation reference.

> **Type**
> *Metashape.EulerAngles*

exportCameras(*path=''*, *format=CamerasFormatXML*$\big[$, *crs*$\big]$, *save_points=True*, *save_markers=False*,

> • **save_markers** (*bool*) – Enables/disables marker export.
>
> • **save_udim** (*bool*) – Enables/disables UDIM texture layout.
>
> • **save_alpha** (*bool*) – Enables/disables alpha channel export.
>
> • **embed_texture** (*bool*) – Embeds texture inside the model file (if supported by format).
>
> • **strip_extensions** (*bool*) – Strips camera label extensions during export.
>
> • **raster_transform** (*Metashape.RasterTransformType*) – Raster band transformation.
>
> • **colors_rgb_8bit** (*bool*) – Convert colors to 8 bit RGB.
>
> • **gltf_y_up** (*bool*) – Enables/disables y-up axes notation used in glTF.
>
> • **comment** (*str*) – Optional comment (if supported by selected format).
>
> • **save_comment** (*bool*) – Enables/disables comment export.
>
> • **format** (*Metashape.ModelFormat*) – Export format.
>
> • **crs** (*Metashape.CoordinateSystem*) – Output coordinate system.
>
> • **shift** (*Metashape.Vector*) – Optional shift to be applied to vertex coordinates.
>
> • **clip_to_boundary** (*bool*) – Clip model to boundary shapes.
>
> • **save_metadata_xml** (*bool*) – Save metadata.xml file.
>
> • **model** (*int*) – Model key to export.
>
> • **viewpoint** (*Metashape.Viewpoint*) – Default view.

- **progress** (`Callable[[float], None]`) – Progress callback.

exportOrthophotos(*path='{filename}.tif'*[, *cameras*], *raster_transform=RasterTransformNone*[, *projection*][, *region*], *resolution=0*, *resolution_x=0*, *resolution_y=0*, *save_kml=False*, *save_world=False*, *save_alpha=True*[, *image_compression*], *white_background=True*, *north_up=True*[, *progress*])

Export orthophotos for the chunk.

> **Parameters**
>
> - **path** (`str`) – Path to output orthophoto.
>
> - **cameras** (`list[int]`) – List of cameras to process.
>
> - **raster_transform** ([`Metashape.RasterTransformType`](Metashape.RasterTransformType)) – Raster band transformation.
>
> - **projection** ([`Metashape.OrthoProjection`](Metashape.OrthoProjection)) – Output projection.
>
> - **region** ([`Metashape.BBox`](Metashape.BBox)) – Region to be exported.
>
> - **resolution** (`float`) – Output resolution in meters.
>
> - **resolution_x** (`float`) – Pixel size in the X dimension in projected units.
>
> - **resolution_y** (`float`) – Pixel size in the Y dimension in projected units.
>
> - **save_kml** (`bool`) – Enable kml file generation.
>
> - **save_world** (`bool`) – Enable world file generation.
>
> - **save_alpha** (`bool`) – Enable alpha channel generation.
>
> - **image_compression** ([`Metashape.ImageCompression`](Metashape.ImageCompression)) – Image compression parameters.
>
> - **white_background** (`bool`) – Enable white background.
>
> - **north_up** (`bool`) – Use north-up orientation for export.
>
> - **progress** (`Callable[[float], None]`) – Progress callback.

exportPointCloud(*path=''*, *source_data=PointCloudData*[, *point_cloud*], *binary=True*, *save_point_color=True*, *save_point_normal=True*, *save_point_intensity=True*, *save_point_classification=True*, *save_point_confidence=True*, *save_point_return_number=True*, *save_point_scan_angle=True*, *save_point_source_id=True*, *save_point_timestamp=True*, *save_point_index=True*, *raster_transform=RasterTransformNone*, *colors_rgb_8bit=True*, *comment=''*, *save_comment=True*, *format=PointCloudFormatNone*, *image_format=ImageFormatJPEG*[, *crs*][, *shift*][, *region*], *clip_to_boundary=True*, *block_width=1000*, *block_height=1000*, *split_in_blocks=False*[, *classes*], *save_images=False*, *compression=True*, *tileset_version='1.0'*, *screen_space_error=16*, *folder_depth=5*[, *viewpoint*], *subdivide_task=True*[, *progress*])

Export point cloud.

> **Parameters**
>
> - **path** (`str`) – Path to output file.
>
> - **source_data** ([`Metashape.DataSource`](Metashape.DataSource)) – Selects between point cloud and tie points. If not specified, uses point cloud if available.
>
> - **point_cloud** (`int`) – Point cloud key to export.
>
> - **binary** (`bool`) – Enables/disables binary encoding for selected format (if applicable).

- **save_point_color** (*bool*) – Enables/disables export of point color.
- **save_point_normal** (*bool*) – Enables/disables export of point normal.
- **save_point_intensity** (*bool*) – Enables/disables export of point intensity.
- **save_point_classification** (*bool*) – Enables/disables export of point classification.
- **save_point_confidence** (*bool*) – Enables/disables export of point confidence.
- **save_point_return_number** (*bool*) – Enables/disables export of point return number.
- **save_point_scan_angle** (*bool*) – Enables/disables export of point scan angle.
- **save_point_source_id** (*bool*) – Enables/disables export of point source ID.
- **save_point_timestamp** (*bool*) – Enables/disables export of point timestamp.
- **save_point_index** (*bool*) – Enables/disables export of point row and column indices.
- **raster_transform** (Metashape.RasterTransformType) – Raster band transformation.
- **colors_rgb_8bit** (*bool*) – Convert colors to 8 bit RGB.
- **comment** (*str*) – Optional comment (if supported by selected format).
- **save_comment** (*bool*) – Enable comment export.
- **format** (Metashape.PointCloudFormat) – Export format.
- **image_format** (Metashape.ImageFormat) – Image data format.
- **crs** (Metashape.CoordinateSystem) – Output coordinate system.
- **shift** (Metashape.Vector) – Optional shift to be applied to point coordinates.
- **region** (Metashape.BBox) – Region to be exported.
- **clip_to_boundary** (*bool*) – Clip point cloud to boundary shapes.
- **block_width** (*float*) – Block width in meters.
- **block_height** (*float*) – Block height in meters.
- **split_in_blocks** (*bool*) – Enable tiled export.
- **classes** (*list[int]*) – List of point classes to be exported.
- **save_images** (*bool*) – Enable image export.
- **compression** (*bool*) – Enable compression (Cesium format only).
- **tileset_version** (*str*) – Cesium 3D Tiles format version to export (1.0 or 1.1).
- **screen_space_error** (*float*) – Target screen space error (Cesium format only).
- **folder_depth** (*int*) – Tileset subdivision depth (Cesium format only).
- **viewpoint** (Metashape.Viewpoint) – Default view.
- **subdivide_task** (*bool*) – Enable fine-level task subdivision.
- **progress** (*Callable[[float], None]*) – Progress callback.

exportRaster(*path='', format=RasterFormatTiles, image_format=ImageFormatNone, raster_transform=RasterTransformNone*[*, projection*][*, region*]*, resolution=0, resolution_x=0, resolution_y=0, block_width=10000, block_height=10000, split_in_blocks=False, width=0, height=0*[*, world_transform*]*, nodata_value=-32767, save_kml=False, save_world=False, save_scheme=False, save_alpha=True, image_description=''*[*, image_compression*]*, network_links=True, global_profile=False, min_zoom_level=-1, max_zoom_level=-1, white_background=True, clip_to_boundary=True, title='Orthomosaic', description='Generated by Agisoft Metashape', source_data=OrthomosaicData*[*, asset*]*, north_up=True, tile_width=256, tile_height=256*[*, progress*])

Export DEM or orthomosaic to file.

> **Parameters**
>
> - **path** (`str`) – Path to output orthomosaic.
>
> - **format** (`Metashape.RasterFormat`) – Export format.
>
> - **image_format** (`Metashape.ImageFormat`) – Tile format.
>
> - **raster_transform** (`Metashape.RasterTransformType`) – Raster band transformation.
>
> - **projection** (`Metashape.OrthoProjection`) – Output projection.
>
> - **region** (`Metashape.BBox`) – Region to be exported.
>
> - **resolution** (`float`) – Output resolution in meters.
>
> - **resolution_x** (`float`) – Pixel size in the X dimension in projected units.
>
> - **resolution_y** (`float`) – Pixel size in the Y dimension in projected units.
>
> - **block_width** (`int`) – Raster block width in pixels.
>
> - **block_height** (`int`) – Raster block height in pixels.
>
> - **split_in_blocks** (`bool`) – Split raster in blocks.
>
> - **width** (`int`) – Raster width.
>
> - **height** (`int`) – Raster height.
>
> - **world_transform** (`Metashape.Matrix`) – 2x3 raster-to-world transformation matrix.
>
> - **nodata_value** (`float`) – No-data value (DEM export only).
>
> - **save_kml** (`bool`) – Enable kml file generation.
>
> - **save_world** (`bool`) – Enable world file generation.
>
> - **save_scheme** (`bool`) – Enable tile scheme files generation.
>
> - **save_alpha** (`bool`) – Enable alpha channel generation.
>
> - **image_description** (`str`) – Optional description to be added to image files.
>
> - **image_compression** (`Metashape.ImageCompression`) – Image compression parameters.
>
> - **network_links** (`bool`) – Enable network links generation for KMZ format.
>
> - **global_profile** (`bool`) – Use global profile (GeoPackage format only).
>
> - **min_zoom_level** (`int`) – Minimum zoom level (GeoPackage, Google Map Tiles, MBTiles and World Wind Tiles formats only).

- **max_zoom_level** (`int`) – Maximum zoom level (GeoPackage, Google Map Tiles, MBTiles and World Wind Tiles formats only).

- **white_background** (`bool`) – Enable white background.

- **clip_to_boundary** (`bool`) – Clip raster to boundary shapes.

- **title** (`str`) – Export title.

- **description** (`str`) – Export description.

- **source_data** ([Metashape.DataSource](#)) – Selects between DEM and orthomosaic.

- **asset** (`int`) – Asset key to export.

- **north_up** (`bool`) – Use north-up orientation for export.

- **tile_width** (`int`) – Tile width in pixels.

- **tile_height** (`int`) – Tile height in pixels.

- **progress** (`Callable[[float], None]`) – Progress callback.

exportReference(*path='', format=ReferenceFormatNone, items=ReferenceItemsCameras, columns='', delimiter=' ', precision=6*[, *progress*])

Export reference data to the specified file.

> **Parameters**
>
> - **path** (`str`) – Path to the output file.
>
> - **format** ([Metashape.ReferenceFormat](#)) – Export format.
>
> - **items** ([Metashape.ReferenceItems](#)) – Items to export in CSV format.
>
> - **columns** (`str`) – Column order in csv format (n - label, o - enabled flag, x/y/z - coordinates, X/Y/Z - coordinate accuracy, a/b/c - rotation angles, A/B/C - rotation angle accuracy, u/v/w - estimated coordinates, U/V/W - coordinate errors, d/e/f - estimated orientation angles, D/E/F - orientation errors, p/q/r - estimated coordinates variance, i/j/k - estimated orientation angles variance, [] - group of multiple values, | - column separator within group).
>
> - **delimiter** (`str`) – Column delimiter in csv format.
>
> - **precision** (`int`) – Number of digits after the decimal point (for CSV format).
>
> - **progress** (`Callable[[float], None]`) – Progress callback.

exportReport(*path='', title='', description='', font_size=12, page_numbers=True, include_system_info=True*[, *user_settings*][, *progress*])

Export processing report in PDF format.

> **Parameters**
>
> - **path** (`str`) – Path to output report.
>
> - **title** (`str`) – Report title.
>
> - **description** (`str`) – Report description.
>
> - **font_size** (`int`) – Font size (pt).
>
> - **page_numbers** (`bool`) – Enable page numbers.
>
> - **include_system_info** (`bool`) – Include system information.
>
> - **user_settings** (`list[tuple[str, str]]`) – A list of user defined settings to include on the Processing Parameters page.

- **progress** (`Callable[[float], None]`) – Progress callback.

exportShapes(*path=''*, *save_points=False*, *save_polylines=False*, *save_polygons=False*[, *groups*ᅟ],
format=ShapesFormatNone[, *crs*ᅟ][, *shift*ᅟ], *polygons_as_polylines=False*, *save_labels=True*,
save_attributes=True[, *progress*ᅟ])

Export shapes layer to file.

>   **Parameters**
>
>   - **path** (`str`) – Path to shape file.
>
>   - **save_points** (`bool`) – Export points.
>
>   - **save_polylines** (`bool`) – Export polylines.
>
>   - **save_polygons** (`bool`) – Export polygons.
>
>   - **groups** (`list[int]`) – A list of shape groups to export.
>
>   - **format** (`Metashape.ShapesFormat`) – Export format.
>
>   - **crs** (`Metashape.CoordinateSystem`) – Output coordinate system.
>
>   - **shift** (`Metashape.Vector`) – Optional shift to be applied to vertex coordinates.
>
>   - **polygons_as_polylines** (`bool`) – Save polygons as polylines.
>
>   - **save_labels** (`bool`) – Export labels.
>
>   - **save_attributes** (`bool`) – Export attributes.
>
>   - **progress** (`Callable[[float], None]`) – Progress callback.

exportTexture(*path=''*, *texture_type=DiffuseMap*, *raster_transform=RasterTransformNone*,
save_alpha=False[, *progress*ᅟ])

Export model texture to file.

>   **Parameters**
>
>   - **path** (`str`) – Path to output file.
>
>   - **texture_type** (`Metashape.Model.TextureType`) – Texture type.
>
>   - **raster_transform** (`Metashape.RasterTransformType`) – Raster band transformation.
>
>   - **save_alpha** (`bool`) – Enable alpha channel export.
>
>   - **progress** (`Callable[[float], None]`) – Progress callback.

exportTiledModel(*path=''*, *format=TiledModelFormatNone*, *model_format=ModelFormatCOLLADA*,
texture_format=ImageFormatJPEG, *raster_transform=RasterTransformNone*[,
*image_compression*ᅟ][, *crs*ᅟ], *clip_to_boundary=True*[, *tiled_model*ᅟ],
model_compression=True, *tileset_version='1.0'*, *use_tileset_transform=True*,
screen_space_error=16, *folder_depth=5*[, *model_group*ᅟ], *pixel_size=0*, *tile_size=256*,
face_count=20000[, *progress*ᅟ])

Export generated tiled model for the chunk.

>   **Parameters**
>
>   - **path** (`str`) – Path to output model.
>
>   - **format** (`Metashape.TiledModelFormat`) – Export format.
>
>   - **model_format** (`Metashape.ModelFormat`) – Model format for zip export.

- **texture_format** (`Metashape.ImageFormat`) – Texture format.

- **raster_transform** (`Metashape.RasterTransformType`) – Raster band transformation.

- **image_compression** (`Metashape.ImageCompression`) – Image compression parameters.

- **crs** (`Metashape.CoordinateSystem`) – Output coordinate system.

- **clip_to_boundary** (`bool`) – Clip tiled model to boundary shapes.

- **tiled_model** (`int`) – Tiled model key to export.

- **model_compression** (`bool`) – Enable mesh compression (Cesium format only).

- **tileset_version** (`str`) – Cesium 3D Tiles format version to export (1.0 or 1.1).

- **use_tileset_transform** (`bool`) – Use tileset transform instead of individual tile transforms (Cesium format only).

- **screen_space_error** (`float`) – Target screen space error (Cesium format only).

- **folder_depth** (`int`) – Tileset subdivision depth (Cesium format only).

- **model_group** (`int`) – Block model key to export.

- **pixel_size** (`float`) – Target model resolution in meters (block model export only).

- **tile_size** (`int`) – Size of tiles in pixels (block model export only).

- **face_count** (`int`) – Number of faces per megapixel of texture resolution (block model export only).

- **progress** (`Callable[[float], None]`) – Progress callback.

filterPointCloud(*point_spacing=0*[, *point_cloud*], *replace_asset=False*[, *frames*][, *progress*])

    Reduce point cloud points number.

        Parameters

- **point_spacing** (`float`) – Desired point spacing (m).

- **point_cloud** (`int`) – Point cloud key to filter.

- **replace_asset** (`bool`) – Replace default asset with filtered point cloud.

- **frames** (`list[int]`) – List of frames to process.

- **progress** (`Callable[[float], None]`) – Progress callback.

findCamera(*key*)

    Find camera by its key.

        Returns

            Found camera.

        Return type

            Metashape.Camera

findCameraGroup(*key*)

    Find camera group by its key.

        Returns

            Found camera group.

> > **Return type**
> > > *Metashape.CameraGroup*

findCameraTrack(*key*)

> Find camera track by its key.

> > **Returns**
> > > Found camera track.

> > **Return type**
> > > *Metashape.CameraTrack*

findDepthMaps(*key*)

> Find depth maps by its key.

> > **Returns**
> > > Found depth maps.

> > **Return type**
> > > *Metashape.DepthMaps*

findElevation(*key*)

> Find elevation model by its key.

> > **Returns**
> > > Found elevation model.

> > **Return type**
> > > *Metashape.Elevation*

findFrame(*key*)

> Find frame by its key.

> > **Returns**
> > > Found frame.

> > **Return type**
> > > *Metashape.Chunk*

findMarker(*key*)

> Find marker by its key.

> > **Returns**
> > > Found marker.

> > **Return type**
> > > *Metashape.Marker*

findMarkerGroup(*key*)

> Find marker group by its key.

> > **Returns**
> > > Found marker group.

> > **Return type**
> > > *Metashape.MarkerGroup*

findModel(*key*)

> Find model by its key.

> > **Returns**
> > > Found model.

> > > **Return type**
> > >   *Metashape.Model*

findOrthomosaic(*key*)

> Find orthomosaic by its key.

> > **Returns**
> >   Found orthomosaic.

> > **Return type**
> >   *Metashape.Orthomosaic*

findPointCloud(*key*)

> Find point cloud by its key.

> > **Returns**
> >   Found point cloud.

> > **Return type**
> >   *Metashape.PointCloud*

findPointCloudGroup(*key*)

> Find point cloud group by its key.

> > **Parameters**
> >   **key** (*int*) – Point cloud group key.

> > **Returns**
> >   Found point cloud group.

> > **Return type**
> >   *Metashape.PointCloudGroup*

findScalebar(*key*)

> Find scalebar by its key.

> > **Returns**
> >   Found scalebar.

> > **Return type**
> >   *Metashape.Scalebar*

findScalebarGroup(*key*)

> Find scalebar group by its key.

> > **Returns**
> >   Found scalebar group.

> > **Return type**
> >   *Metashape.ScalebarGroup*

findSensor(*key*)

> Find sensor by its key.

> > **Returns**
> >   Found sensor.

> > **Return type**
> >   *Metashape.Sensor*

findTiledModel(*key*)

    Find tiled model by its key.

        Returns

            Found tiled model.

        Return type

            [Metashape.TiledModel](#)

frame

    Current frame index.

        Type

            int

frames

    List of frames in the chunk.

        Type

            list[*[Metashape.Chunk](#)*]

generateMasks(*path='{filename}_mask.png'*, *masking_mode=MaskingModeAlpha*, *mask_operation=MaskOperationReplacement*, *tolerance=10*[, *cameras*], *mask_defocus=False*, *fix_coverage=True*, *blur_threshold=3*, *depth_threshold=3.40282e+38*[, *progress*])

    Generate masks for multiple cameras.

        Parameters

- **path** (`str`) – Mask file name template.

- **masking_mode** ([Metashape.MaskingMode](#)) – Mask generation mode.

- **mask_operation** ([Metashape.MaskOperation](#)) – Mask operation.

- **tolerance** (`int`) – Background masking tolerance.

- **cameras** (`list[int]`) – Optional list of cameras to be processed.

- **mask_defocus** (`bool`) – Mask defocus areas.

- **fix_coverage** (`bool`) – Extend masks to cover whole mesh (only if mask_defocus=True).

- **blur_threshold** (`float`) – Allowed blur radius on a photo in pix (only if mask_defocus=True).

- **depth_threshold** (`float`) – Maximum depth of masked areas in meters (only if mask_defocus=False).

- **progress** (`Callable[[float], None]`) – Progress callback.

generatePrescriptionMap(*class_count=4*, *cell_size=1*, *classification_method=JenksNaturalBreaksClassification*[, *boundary_shape_group*][, *breakpoints*][, *rates*][, *progress*])

    Generate prescription map for orthomosaic.

        Parameters

- **class_count** (`int`) – Number of classes.

- **cell_size** (`float`) – Step of prescription grid, meters.

- **classification_method** ([Metashape.ClassificationMethod](#)) – Index values classification method.

- **boundary_shape_group** (`int`) – Boundary shape group.

- **breakpoints** (`list[float]`) – Classification breakpoints.

- **rates** (`list[float]`) – Fertilizer rate for each class.

- **progress** (`Callable[[float], None]`) – Progress callback.

image_brightness

    Image brightness as percentage.

        Type

            float

image_contrast

    Image contrast as percentage.

        Type

            float

importCameras(*path='', format=CamerasFormatXML*$\left[\right.$*, crs*$\left.\right]$*, image_orientation=0, image_list='list.txt', load_image_list=False*$\left[\right.$*, progress*$\left.\right]$)

    Import camera positions.

        Parameters

- **path** (`str`) – Path to the file.

- **format** ([Metashape.CamerasFormat](#)) – File format.

- **crs** ([Metashape.CoordinateSystem](#)) – Ground coordinate system.

- **image_orientation** (`int`) – Image coordinate system (0 - X right, 1 - X up, 2 - X left, 3 - X down).

- **image_list** (`str`) – Path to image list file (Bundler format only).

- **load_image_list** (`bool`) – Enable Bundler image list import.

- **progress** (`Callable[[float], None]`) – Progress callback.

importDepthImages(*format=PointCloudFormatNone*$\left[\right.$*, filenames*$\left.\right]$$\left[\right.$*, color_filenames*$\left.\right]$*, image_path='', multiplane=False*$\left[\right.$*, progress*$\left.\right]$)

    Import images with depth data.

        Parameters

- **format** ([Metashape.PointCloudFormat](#)) – Point cloud format.

- **filenames** (`list[str]`) – List of files to import.

- **color_filenames** (`list[str]`) – List of corresponding color files, if present.

- **image_path** (`str`) – Path template to output files.

- **multiplane** (`bool`) – Import as a multi-camera system

- **progress** (`Callable[[float], None]`) – Progress callback.

importMarkers(*path=''*$\left[\right.$*, progress*$\left.\right]$)

    Import markers.

        Parameters

- **path** (`str`) – Path to the file.

- **progress** (`Callable[[float], None]`) – Progress callback.

importModel(*path=''*, *format=ModelFormatNone*[, *crs*][, *shift*], *decode_udim=True*,
     replace_asset=False[, *frame_paths*][, *progress*])

>   Import model from file.

>> **Parameters**

>>> • **path** (`str`) – Path to model.

>>> • **format** (`Metashape.ModelFormat`) – Model format.

>>> • **crs** (`Metashape.CoordinateSystem`) – Model coordinate system.

>>> • **shift** (`Metashape.Vector`) – Optional shift to be applied to vertex coordinates.

>>> • **decode_udim** (`bool`) – Load UDIM texture layout.

>>> • **replace_asset** (`bool`) – Replace default asset with imported model.

>>> • **frame_paths** (`list[str]`) – List of model paths to import in each frame of a multiframe chunk.

>>> • **progress** (`Callable[[float], None]`) – Progress callback.

importPointCloud(*path=''*, *format=PointCloudFormatNone*[, *crs*][, *shift*], *precision=0*,
     is_laser_scan=False, *replace_asset=False*, *import_images=True*,
     calculate_normals=True, *ignore_normals=False*, *point_neighbors=28*,
     scanner_at_origin=False, *ignore_scanner_origin=False*, *ignore_trajectory=False*[,
     trajectory][, *frame_paths*][, *progress*])

>   Import point cloud from file.

>> **Parameters**

>>> • **path** (`str`) – Path to point cloud.

>>> • **format** (`Metashape.PointCloudFormat`) – Point cloud format.

>>> • **crs** (`Metashape.CoordinateSystem`) – Point cloud coordinate system.

>>> • **shift** (`Metashape.Vector`) – Optional shift to be applied to point coordinates.

>>> • **precision** (`float`) – Coordinate precision (m). For default precision use 0.

>>> • **is_laser_scan** (`bool`) – Import point clouds as laser scans.

>>> • **replace_asset** (`bool`) – Replace default asset with imported point cloud.

>>> • **import_images** (`bool`) – Import images embedded in laser scan.

>>> • **calculate_normals** (`bool`) – Calculate point normals.

>>> • **ignore_normals** (`bool`) – Ignore normals in imported file.

>>> • **point_neighbors** (`int`) – Number of point neighbors to use for normal estimation.

>>> • **scanner_at_origin** (`bool`) – Use laser scan origin as scanner position for unstructured point clouds.

>>> • **ignore_scanner_origin** (`bool`) – Do not use laser scan origin as scanner position for structured point clouds.

>>> • **ignore_trajectory** (`bool`) – Do not attach trajectory to imported point cloud.

>>> • **trajectory** (`int`) – Trajectory key to attach.

>>> • **frame_paths** (`list[str]`) – List of point cloud paths to import in each frame of a multiframe chunk.

- **progress** (`Callable[[float], None]`) – Progress callback.

importRaster(*path=''*$\big[$*, crs*$\big]$*, raster_type=ElevationData*, *nodata_value=-32767*, *has_nodata_value=False*, *replace_asset=False*$\big[$*, frames*$\big]\big[$*, progress*$\big]$)

    Import DEM or orthomosaic from file.

    Parameters

- **path** (`str`) – Path to elevation model in GeoTIFF format.

- **crs** (`Metashape.CoordinateSystem`) – Default coordinate system if not specified in GeoTIFF file.

- **raster_type** (`Metashape.DataSource`) – Type of raster layer to import.

- **nodata_value** (`float`) – No-data value.

- **has_nodata_value** (`bool`) – No-data value valid flag.

- **replace_asset** (`bool`) – Replace default raster with imported one.

- **frames** (`list[int]`) – List of frames to process.

- **progress** (`Callable[[float], None]`) – Progress callback.

importReference(*path=''*, *format=ReferenceFormatCSV*, *columns=''*, *delimiter=''*, *group_delimiters=False*, *skip_rows=0*$\big[$*, items*$\big]\big[$*, crs*$\big]$*, ignore_labels=False*, *create_markers=False*, *threshold=0.1*, *shutter_lag=0*$\big[$*, progress*$\big]$)

    Import reference data from the specified file.

    Parameters

- **path** (`str`) – Path to the file with reference data.

- **format** (`Metashape.ReferenceFormat`) – File format.

- **columns** (`str`) – Column order in csv format (n - label, o - enabled flag, x/y/z - coordinates, X/Y/Z - coordinate accuracy, a/b/c - rotation angles, A/B/C - rotation angle accuracy, [] - group of multiple values, | - column separator within group).

- **delimiter** (`str`) – Column delimiter in csv format.

- **group_delimiters** (`bool`) – Combine consecutive delimiters in csv format.

- **skip_rows** (`int`) – Number of rows to skip in (csv format only).

- **items** (`Metashape.ReferenceItems`) – List of items to load reference for (csv format only).

- **crs** (`Metashape.CoordinateSystem`) – Reference data coordinate system (csv format only).

- **ignore_labels** (`bool`) – Matches reference data based on coordinates alone (csv format only).

- **create_markers** (`bool`) – Create markers for missing entries (csv format only).

- **threshold** (`float`) – Error threshold in meters used when ignore_labels is set (csv format only).

- **shutter_lag** (`float`) – Shutter lag in seconds (APM format only).

- **progress** (`Callable[[float], None]`) – Progress callback.

importShapes(*path=''*, *replace=False*, *boundary_type=NoBoundary*, *format=ShapesFormatNone*, *columns='nxyzd'*, *delimiter=', '*, *group_delimiters=False*, *skip_rows=0*[, *crs*][, *progress*])

Import shapes layer from file.

> **Parameters**
>
> - **path** (`str`) – Path to shape file.
>
> - **replace** (`bool`) – Replace current shapes with new data.
>
> - **boundary_type** ([`Metashape.Shape.BoundaryType`](#)) – Boundary type to be applied to imported shapes.
>
> - **format** ([`Metashape.ShapesFormat`](#)) – Shapes format.
>
> - **columns** (`str`) – Column order in csv format (n - label, x/y/z - coordinates, d - description, [] - group of multiple values, | - column separator within group).
>
> - **delimiter** (`str`) – Column delimiter in csv format.
>
> - **group_delimiters** (`bool`) – Combine consequitive delimiters in csv format.
>
> - **skip_rows** (`int`) – Number of rows to skip in (csv format only).
>
> - **crs** ([`Metashape.CoordinateSystem`](#)) – Reference data coordinate system (csv format only).
>
> - **progress** (`Callable[[float], None]`) – Progress callback.

importTiledModel(*path=''*[, *progress*])

Import tiled model from file.

> **Parameters**
>
> - **path** (`str`) – Path to tiled model.
>
> - **progress** (`Callable[[float], None]`) – Progress callback.

importTrajectory(*path=''*, *format=TrajectoryFormatNone*, *columns='txyz'*, *delimiter=' '*, *skip_rows=0*[, *crs*][, *shift*], *replace_asset=False*[, *progress*])

Import trajectory from file.

> **Parameters**
>
> - **path** (`str`) – Trajectory file path.
>
> - **format** ([`Metashape.TrajectoryFormat`](#)) – Trajectory format.
>
> - **columns** (`str`) – Column order (t - time, x/y/z - coordinates, a/b/c - rotation angles, space - skip column).
>
> - **delimiter** (`str`) – CSV delimiter.
>
> - **skip_rows** (`int`) – Number of rows to skip.
>
> - **crs** ([`Metashape.CoordinateSystem`](#)) – Point cloud coordinate system.
>
> - **shift** ([`Metashape.Vector`](#)) – Optional shift to be applied to point coordinates.
>
> - **replace_asset** (`bool`) – Replace default asset with imported trajectory.
>
> - **progress** (`Callable[[float], None]`) – Progress callback.

importVideo(*path*, *image_path*, *frame_step=CustomFrameStep*, *custom_frame_step=1*, *time_start=0*, *time_end=-1*)

Imports video to active chunk.

> **Parameters**
>
> - **path** (`str`) – Path to source video.
>
> - **image_path** (`str`) – Path to directory where to save frames with filename template. For example: /path/to/dir/frame{filenum}.png.
>
> - **frame_step** (`Metashape.FrameStep`) – Frame step type.
>
> - **custom_frame_step** (`int`) – Every custom_frame_step'th frame will be saved. Used for frame_step=CustomFrameStep.
>
> - **time_start** (`int`) – The starting point for importing video, in milliseconds.
>
> - **time_end** (`int`) – The endpoint for importing video, in milliseconds.

key

> Chunk identifier.
>
> > **Type**
> >
> > int

label

> Chunk label.
>
> > **Type**
> >

loadReferenceExif(*load_rotation=False*, *load_accuracy=False*)

> Import camera locations from EXIF meta data.
>
> > **Parameters**
> >
> > - **load_rotation** (`bool`) – load yaw, pitch and roll orientation angles.
> >
> > - **load_accuracy** (`bool`) – load camera location accuracy.

loadReflectancePanelCalibration(*path*[, *cameras*])

> Load reflectance panel calibration from CSV file.
>
> > **Parameters**
> >
> > - **path** (`str`) – Path to calibration file.
> >
> > - **cameras** (`list[Metashape.Camera]`) – List of cameras to process.

locateReflectancePanels([*progress*])

> Locate reflectance panels based on QR-codes.
>
> > **Parameters**
> >
> > **progress** (`Callable[[float], None]`) – Progress callback.

marker_crs

> Coordinate system used for marker reference data.
>
> > **Type**
> >
> > *Metashape.CoordinateSystem*

marker_groups

> List of marker groups in the chunk.
>
> > **Type**
> >
> > list[*Metashape.MarkerGroup*]

marker_location_accuracy

Expected accuracy of marker coordinates in meters.

> **Type**
>> *Metashape.Vector*

marker_projection_accuracy

Expected accuracy of marker projections in pixels.

> **Type**
>> float

markers

List of Regular, Vertex and Fiducial markers in the chunk.

> **Type**
>> list[*Metashape.Marker*]

masks

Image masks.

> **Type**
>> *Metashape.Masks*

matchPhotos(*downscale=1*, *downscale_3d=1*, *generic_preselection=True*, *reference_preselection=True*, *reference_preselection_mode=ReferencePreselectionSource*, *filter_mask=False*, *mask_tiepoints=True*, *filter_stationary_points=True*, *keypoint_limit=40000*, *keypoint_limit_3d=100000*, *keypoint_limit_per_mpx=1000*, *tiepoint_limit=4000*, *keep_keypoints=False*[, *pairs*][, *cameras*], *guided_matching=False*, *reset_matches=False*, *subdivide_task=True*, *workitem_size_cameras=20*, *workitem_size_pairs=80*, *max_workgroup_size=100*, *laser_scans_vertical_axis=0*, *match_laser_scans=False*[, *progress*])

Perform image matching for the chunk frame.

> **Parameters**
>
> - **downscale** (*int*) – Image alignment accuracy (0 - Highest, 1 - High, 2 - Medium, 4 - Low, 8 - Lowest).
>
> - **downscale_3d** (*int*) – Laser scan alignment accuracy (1 - Highest, 2 - High, 4 - Medium, 8 - Low, 16 - Lowest).
>
> - **generic_preselection** (*bool*) – Enable generic preselection.
>
> - **reference_preselection** (*bool*) – Enable reference preselection.
>
> - **reference_preselection_mode** (Metashape.ReferencePreselectionMode) – Reference preselection mode.
>
> - **filter_mask** (*bool*) – Filter points by mask.
>
> - **mask_tiepoints** (*bool*) – Apply mask filter to tie points.
>
> - **filter_stationary_points** (*bool*) – Exclude tie points which are stationary across images.
>
> - **keypoint_limit** (*int*) – Key point limit.
>
> - **keypoint_limit_3d** (*int*) – Key point limit for laser scans.
>
> - **keypoint_limit_per_mpx** (*int*) – Key point limit per megapixel.
>
> - **tiepoint_limit** (*int*) – Tie point limit.

- **keep_keypoints** (*bool*) – Store keypoints in the project.
- **pairs** (*list[tuple[int, int]]*) – User defined list of camera pairs to match.
- **cameras** (*list[int]*) – List of cameras to match.
- **guided_matching** (*bool*) – Enable guided image matching.
- **reset_matches** (*bool*) – Reset current matches.
- **subdivide_task** (*bool*) – Enable fine-level task subdivision.
- **workitem_size_cameras** (*int*) – Number of cameras in a workitem.
- **workitem_size_pairs** (*int*) – Number of image pairs in a workitem.
- **max_workgroup_size** (*int*) – Maximum workgroup size.
- **laser_scans_vertical_axis** (*int*) – Common laser scans axis.
- **match_laser_scans** (*bool*) – Match laser scans using geometric features.
- **progress** (*Callable[[float], None]*) – Progress callback.

mergeComponents(*components*[, *progress*])

Merge components.

> **Parameters**
>
> - **components** (*list[Metashape.Component]*) – List of components to merge.
> - **progress** (*Callable[[float], None]*) – Progress callback.

meta

Chunk meta data.

> **Type**
>
> *Metashape.MetaData*

model

Default model for the current frame.

> **Type**
>
> *Metashape.Model*

model_group

Default model group for the current chunk.

> **Type**
>
> *Metashape.ModelGroup*

model_groups

List of model groups in the chunk.

> **Type**
>
> list[*Metashape.ModelGroup*]

models

List of models for the current frame.

> **Type**
>
> list[*Metashape.Model*]

modified

Modified flag.

> **Type**
>
> bool

optimizeCameras(*fit_f=True*, *fit_cx=True*, *fit_cy=True*, *fit_b1=False*, *fit_b2=False*, *fit_k1=True*,
fit_k2=True, *fit_k3=True*, *fit_k4=False*, *fit_p1=True*, *fit_p2=True*, *fit_corrections=False*,
adaptive_fitting=False, *tiepoint_covariance=False*[, *progress*])

Perform optimization of tie points / camera parameters.

> **Parameters**
>
> - **fit_f** (*bool*) – Enable optimization of focal length coefficient.
> - **fit_cx** (*bool*) – Enable optimization of X principal point coordinates.
> - **fit_cy** (*bool*) – Enable optimization of Y principal point coordinates.
> - **fit_b1** (*bool*) – Enable optimization of aspect ratio.
> - **fit_b2** (*bool*) – Enable optimization of skew coefficient.
> - **fit_k1** (*bool*) – Enable optimization of k1 radial distortion coefficient.
> - **fit_k2** (*bool*) – Enable optimization of k2 radial distortion coefficient.
> - **fit_k3** (*bool*) – Enable optimization of k3 radial distortion coefficient.
> - **fit_k4** (*bool*) – Enable optimization of k3 radial distortion coefficient.
> - **fit_p1** (*bool*) – Enable optimization of p1 tangential distortion coefficient.
> - **fit_p2** (*bool*) – Enable optimization of p2 tangential distortion coefficient.
> - **fit_corrections** (*bool*) – Enable optimization of additional corrections.
> - **adaptive_fitting** (*bool*) – Enable adaptive fitting of distortion coefficients.
> - **tiepoint_covariance** (*bool*) – Estimate tie point covariance matrices.
> - **progress** (*Callable[[float], None]*) – Progress callback.

orthomosaic

Default orthomosaic for the current frame.

> **Type**
>
> *[Metashape.Orthomosaic](#)*

orthomosaics

List of orthomosaics for the current frame.

> **Type**
>
> list[*[Metashape.Orthomosaic](#)*]

point_cloud

Default point cloud for the current frame.

> **Type**
>
> *[Metashape.PointCloud](#)*

point_cloud_groups

List of point cloud groups in the chunk.

> **Type**
>
> list[*[Metashape.PointCloudGroup](#)*]

point_clouds

List of point clouds for the current frame.

> **Type**
>> list[*Metashape.PointCloud*]

primary_channel

Primary channel index (-1 for default).

> **Type**
>> int

publishData(*service=ServiceSketchfab*, *source_data=TiePointsData*,
raster_transform=RasterTransformNone, *save_point_color=True*, *save_camera_track=True*,
title='', *description=''*, *tags=''*, *owner=''*, *token=''*, *username=''*, *password=''*, *account=''*,
hostname='', *is_draft=False*, *is_private=False*, *is_protected=False*, *tile_size=256*,
min_zoom_level=-1, *max_zoom_level=-1*[, *projection*], *resolution=0*[, *point_classes*][,
image_compression][, *progress*])

Publish generated data online.

> **Parameters**
>
> - **service** ([Metashape.ServiceType](#)) – Service to upload on.
>
> - **source_data** ([Metashape.DataSource](#)) – Asset type to upload.
>
> - **raster_transform** ([Metashape.RasterTransformType](#)) – Raster band transformation.
>
> - **save_point_color** (*bool*) – Enables/disables export of point colors.
>
> - **save_camera_track** (*bool*) – Enables/disables export of camera track.
>
> - **title** (*str*) – Dataset title.
>
> - **description** (*str*) – Dataset description.
>
> - **tags** (*str*) – Dataset tags.
>
> - **owner** (*str*) – Account owner (Cesium and Mapbox services).
>
> - **token** (*str*) – Account token (Cesium, Mapbox, Picterra, Pointbox and Sketchfab services).
>
> - **username** (*str*) – Account username (4DMapper, Melown and Pointscene services).
>
> - **password** (*str*) – Account password (4DMapper, Melown, Pointscene and Sketchfab services).
>
> - **account** (*str*) – Account name (Melown service).
>
> - **hostname** (*str*) – Service hostname (4DMapper service).
>
> - **is_draft** (*bool*) – Mark dataset as draft (Sketchfab service).
>
> - **is_private** (*bool*) – Set dataset access to private (Pointbox and Sketchfab services).
>
> - **is_protected** (*bool*) – Set dataset access to protected (Pointbox service).
>
> - **tile_size** (*int*) – Tile size in pixels.
>
> - **min_zoom_level** (*int*) – Minimum zoom level.
>
> - **max_zoom_level** (*int*) – Maximum zoom level.
>
> - **projection** ([Metashape.CoordinateSystem](#)) – Output projection.

- **resolution** (`float`) – Output resolution in meters.

- **point_classes** (`list[int]`) – List of point classes to be exported.

- **image_compression** (`Metashape.ImageCompression`) – Image compression parameters.

- **progress** (`Callable[[float], None]`) – Progress callback.

raster_transform

Raster transform.

> **Type**
> *Metashape.RasterTransform*

reduceOverlap(*overlap=3*, *use_selection=False*[, *progress*])

Disable redundant cameras.

> **Parameters**
>
> - **overlap** (`int`) – Target number of cameras observing each point of the surface.
>
> - **use_selection** (`bool`) – Focus on model selection.
>
> - **progress** (`Callable[[float], None]`) – Progress callback.

refineMarkers([*markers*][, *progress*])

Refine markers based on images content.

> **Parameters**
>
> - **markers** (`list[int]`) – Optional list of markers to be processed.
>
> - **progress** (`Callable[[float], None]`) – Progress callback.

refineModel(*downscale=4*, *iterations=10*, *smoothness=0.5*[, *cameras*][, *progress*])

Refine polygonal model.

> **Parameters**
>
> - **downscale** (`int`) – Refinement quality (1 - Ultra high, 2 - High, 4 - Medium, 8 - Low, 16 - Lowest).
>
> - **iterations** (`int`) – Number of refinement iterations.
>
> - **smoothness** (`float`) – Smoothing strength. Should be in range [0, 1].
>
> - **cameras** (`list[int]`) – List of cameras to process.
>
> - **progress** (`Callable[[float], None]`) – Progress callback.

region

Reconstruction volume selection.

> **Type**
> *Metashape.Region*

remove(*items*)

Remove items from the chunk.

> **Parameters**
> **items** (`list[Metashape.Chunk` / `Metashape.Sensor` / `Metashape.CameraGroup` / `Metashape.MarkerGroup` / `Metashape.ScalebarGroup` / `Metashape.Camera` / `Metashape.Marker` / `Metashape.Scalebar` / `Metashape.CameraTrack]`) – A list of items to be removed.

removeLighting(*color_mode=False*, *internal_blur=1.5*, *mesh_noise_suppression=1*, *ambient_occlusion_path=''*, *ambient_occlusion_multiplier=1.5*[, *progress*])

  Generate model for the chunk frame.

  Parameters

  - **color_mode** (*bool*) – Enable multi-color processing mode.

  - **internal_blur** (*float*) – Internal blur. Should be in range [0, 4].

  - **mesh_noise_suppression** (*float*) – Mesh normals noise suppression strength. Should be in range [0, 4].

  - **ambient_occlusion_path** (*str*) – Path to ambient occlusion texture atlas. Can be empty.

  - **ambient_occlusion_multiplier** (*float*) – Ambient occlusion multiplier. Should be in range [0.25, 4].

  - **progress** (*Callable[[float], None]*) – Progress callback.

renderPreview(*width = 2048*, *height = 2048*[, *transform*], *point_size=1*[, *progress*])

  Generate preview image for the chunk.

  Parameters

  - **width** (*int*) – Preview image width.

  - **height** (*int*) – Preview image height.

  - **transform** (*Metashape.Matrix*) – 4x4 viewpoint transformation matrix.

  - **point_size** (*int*) – Point size.

  - **progress** (*Callable[[float], None]*) – Progress callback.

  Returns
    Preview image.

  Return type
    Metashape.Image

resetRegion()

  Reset reconstruction volume selector to default position.

scalebar_accuracy

  Expected scale bar accuracy in meters.

  Type
    float

scalebar_groups

  List of scale bar groups in the chunk.

  Type
    list[*Metashape.ScalebarGroup*]

scalebars

  List of scale bars in the chunk.

  Type
    list[*Metashape.Scalebar*]

selected

Selects/deselects the chunk.

> **Type**
>> bool

sensors

List of sensors in the chunk.

> **Type**
>> list[*Metashape.Sensor*]

shapes

Shapes for the current frame.

> **Type**
>> *Metashape.Shapes*

smoothModel(*strength=3*, *apply_to_selection=False*, *fix_borders=True*, *preserve_edges=False*[, *model*][, *progress*])

Smooth model using Laplacian smoothing algorithm.

> **Parameters**
>> - **strength** (*float*) – Smoothing strength.
>>
>> - **apply_to_selection** (*bool*) – Apply to selected faces.
>>
>> - **fix_borders** (*bool*) – Fix borders.
>>
>> - **preserve_edges** (*bool*) – Preserve edges.
>>
>> - **model** (*int*) – Key of model to smooth.
>>
>> - **progress** (*Callable[[float], None]*) – Progress callback.

smoothPointCloud(*smoothing_radius=0*[, *point_cloud*][, *classes*], *apply_to_selection=False*[, *progress*])

Smooth point cloud.

> **Parameters**
>> - **smoothing_radius** (*float*) – Desired smoothing radius (m).
>>
>> - **point_cloud** (*int*) – Key of point cloud to filter.
>>
>> - **classes** (*list[int]*) – List of point classes to be smoothed.
>>
>> - **apply_to_selection** (*bool*) – Smooth points within selection.
>>
>> - **progress** (*Callable[[float], None]*) – Progress callback.

sortCameras()

Sorts cameras by their labels.

sortMarkers()

Sorts markers by their labels.

sortScalebars()

Sorts scalebars by their labels.

splitComponents(*items*[, *progress*])

Split components.

> **Parameters**
>
> - **items** (*list[Metashape.Camera | Metashape.PointCloud]*) – List of items to split.
> - **progress** (*Callable[[float], None]*) – Progress callback.

thinTiePoints(*point_limit=1000*)

Remove excessive tracks from the tie point cloud.

> **Parameters**
> **point_limit** (*int*) – Maximum number of points for each photo.

thumbnails

Image thumbnails.

> **Type**
> *Metashape.Thumbnails*

tie_points

Generated tie point cloud.

> **Type**
> *Metashape.TiePoints*

tiepoint_accuracy

Expected tie point accuracy in pixels.

> **Type**
> float

tiled_model

Default tiled model for the current frame.

> **Type**
> *Metashape.TiledModel*

tiled_models

List of tiled models for the current frame.

> **Type**
> list[*Metashape.TiledModel*]

trackMarkers(*first_frame=0*, *last_frame=0*[, *progress*])

Track marker projections through the frame sequence.

> **Parameters**
>
> - **first_frame** (*int*) – Starting frame index.
> - **last_frame** (*int*) – Ending frame index.
> - **progress** (*Callable[[float], None]*) – Progress callback.

transform

4x4 matrix specifying chunk location in the world coordinate system.

> **Type**
> *Metashape.ChunkTransform*

transformRaster(*source_data=ElevationData*[, *asset*], *subtract=False*[, *operand_chunk*][, *operand_frame*][, *operand_asset*], *width=0*, *height=0*[, *world_transform*], *resolution=0*, *resolution_x=0*, *resolution_y=0*, *nodata_value=-32767*, *north_up=True*[, *region*][, *projection*], *replace_asset=False*[, *frames*][, *progress*])

Transform DEM or orthomosaic.

> **Parameters**
>
> - **source_data** (`Metashape.DataSource`) – Selects between DEM and orthomosaic.
> - **asset** (`int`) – Asset key to transform.
> - **subtract** (`bool`) – Subtraction flag.
> - **operand_chunk** (`int`) – Operand chunk key.
> - **operand_frame** (`int`) – Operand frame key.
> - **operand_asset** (`int`) – Operand asset key.
> - **width** (`int`) – Raster width.
> - **height** (`int`) – Raster height.
> - **world_transform** (`Metashape.Matrix`) – 2x3 raster-to-world transformation matrix.
> - **resolution** (`float`) – Output resolution in meters.
> - **resolution_x** (`float`) – Pixel size in the X dimension in projected units.
> - **resolution_y** (`float`) – Pixel size in the Y dimension in projected units.
> - **nodata_value** (`float`) – No-data value (DEM export only).
> - **north_up** (`bool`) – Use north-up orientation for export.
> - **region** (`Metashape.BBox`) – Region to be processed.
> - **projection** (`Metashape.OrthoProjection`) – Output projection.
> - **replace_asset** (`bool`) – Replace default raster with transformed one.
> - **frames** (`list[int]`) – List of frames to process.
> - **progress** (`Callable[[float], None]`) – Progress callback.

triangulateTiePoints(*max_error=10*, *min_image=2*[, *progress*])

Rebuild tie point cloud for the chunk.

> **Parameters**
>
> - **max_error** (`float`) – Reprojection error threshold.
> - **min_image** (`int`) – Minimum number of point projections.
> - **progress** (`Callable[[float], None]`) – Progress callback.

updateTransform()

Update chunk transformation based on reference data.

world_crs

Coordinate system used as world coordinate system.

> **Type**
> *Metashape.CoordinateSystem*

class Metashape.**ChunkTransform**

> Transformation between chunk and world coordinates systems.

> **copy()**

>> Return a copy of the object.

>>> **Returns**
>>>> A copy of the object.

>>> **Return type**
>>>> *Metashape.ChunkTransform*

> **matrix**

>> Transformation matrix.

>>> **Type**
>>>> *Metashape.Matrix*

> **rotation**

>> Rotation component.

>>> **Type**
>>>> *Metashape.Matrix*

> **scale**

>> Scale component.

>>> **Type**
>>>> float

> **translation**

>> Translation component.

>>> **Type**
>>>> *Metashape.Vector*

class Metashape.**CirTransform**

> CIR calibration matrix.

> **calibrate()**

>> Calibrate CIR matrix based on orthomosaic histogram.

> **coeffs**

>> Color matrix.

>>> **Type**
>>>> *Metashape.Matrix*

> **copy()**

>> Return a copy of the object.

>>> **Returns**
>>>> A copy of the object.

>>> **Return type**
>>>> *Metashape.CirTransform*

> **reset()**

>> Reset CIR calibration matrix.

class Metashape.`ClassificationMethod`

> Index values classification method in [EqualIntervalsClassification, JenksNaturalBreaksClassification]

class Metashape.`CloudClient`

> CloudClient class provides access to the Agisoft Cloud processing service and allows to create and manage cloud projects.
>
> The following example connects to the service and lists available projects:

```
>>> import Metashape
>>> client = Metashape.CloudClient()
>>> client.username = 'user'
>>> client.password = 'password'
>>> client.projectList()
```

> **abortProcessing**(*document*)
>
> > Cancel processing.
> >
> > > **Parameters**
> > > > **document** ([Metashape.Document](#)) – Project to cancel.
>
> **client_id**
>
> > Client software id (optional).
> >
> > > **Type**
> > > > str
>
> **client_secret**
>
> > Client softrwae secret (optional).
> >
> > > **Type**
> > > > str
>
> **downloadProject**(*document*[, *progress*])
>
> > Download project from the cloud.
> >
> > > **Parameters**
> > > > • **document** ([Metashape.Document](#)) – Project to download.
> > > >
> > > > • **progress** (*Callable[[float], None]*) – Progress callback.
>
> **getProcessingStatus**(*document*)
>
> > Get processing status.
> >
> > > **Parameters**
> > > > **document** ([Metashape.Document](#)) – Project being processed.
> > >
> > > **Returns**
> > > > Processing status.
> > >
> > > **Return type**
> > > > dict
>
> **getProjectList**()
>
> > Get list of projects in the cloud.
> >
> > > **Returns**
> > > > List of projects.

> **Return type**
>> list

password
>> Cloud account password.
>>
>>> **Type**
>>>> str

processProject(*document*, *tasks*)
>> Start processing in the cloud.
>>
>>> **Parameters**
>>>
>>> • **document** ([Metashape.Document](#)) – Project to process.
>>>
>>> • **tasks** (`list[Metashape.NetworkTask]`) – List of processing tasks to execute.

uploadProject(*document*, *publish=False*[, *progress*])
>> Upload project to the cloud.
>>
>>> **Parameters**
>>>
>>> • **document** ([Metashape.Document](#)) – Project to upload.
>>>
>>> • **publish** (`bool`) – Publish project for online visualization.
>>>
>>> • **progress** (`Callable[[float], None]`) – Progress callback.

username
>> Cloud account username.
>>
>>> **Type**
>>>> str

class Metashape.**Component**
>> Component instance

chunk
>> Chunk the component belongs to.
>>
>>> **Type**
>>>> *[Metashape.Chunk](#)*

key
>> Component identifier.
>>
>>> **Type**
>>>> int

label
>> Component label.
>>
>>> **Type**
>>>> str

partition
>> Component partition.
>>
>>> **Type**
>>>> list

region

>Reconstruction volume selection.

>>**Type**
>>*Metashape.Region*

transform

>4x4 matrix specifying chunk location in the world coordinate system.

>>**Type**
>>*Metashape.ChunkTransform*

class Metashape.**CoordinateSystem**

>Coordinate reference system (local, geographic or projected).

>The following example changes chunk coordinate system to WGS 84 / UTM zone 41N and loads reference data from file:

```
>>> import Metashape
>>> chunk = Metashape.app.document.chunk
>>> chunk.crs = Metashape.CoordinateSystem("EPSG::32641")
>>> chunk.importReference("gcp.txt", Metashape.ReferenceFormatCSV)
>>> chunk.updateTransform()
```

>**addGeoid**(*path*)

>>Register geoid model.

>>>**Parameters**
>>>**path** (*str*) – Path to geoid file.

>**authority**

>>Authority identifier of the coordinate system.

>>>**Type**
>>>str

>**copy**()

>>Return a copy of the object.

>>>**Returns**
>>>A copy of the object.

>>>**Return type**
>>>*Metashape.CoordinateSystem*

>**datumTransform**(*source*, *target*)

>>Coordinate transformation from source to target coordinate system datum.

>>>**Parameters**
>>>- **source** (`Metashape.CoordinateSystem`) – Source coordinate system.
>>>- **target** (`Metashape.CoordinateSystem`) – Target coordinate system.

>>>**Returns**
>>>4x4 transformation matrix.

>>>**Return type**
>>>*Metashape.Matrix*

geoccs
>   Base geocentric coordinate system.

>   > **Type**
>   > *[Metashape.CoordinateSystem](#)*

geogcs
>   Base geographic coordinate system.

>   > **Type**
>   > *[Metashape.CoordinateSystem](#)*

geoid_height
>   Fixed geoid height to be used instead of interpolated values.

>   > **Type**
>   > float

init(*crs*)
>   Initialize projection based on specified WKT definition or authority identifier.

>   > **Parameters**
>   > **crs** (`str`) – WKT definition of coordinate system or authority identifier.

listBuiltinCRS()
>   Returns a list of builtin coordinate systems.

localframe(*point*)
>   Returns 4x4 transformation matrix to LSE coordinates at the given point.

>   > **Parameters**
>   > **point** (`Metashape.Vector`) – Coordinates of the origin in the geocentric coordinates.

>   > **Returns**
>   > Transformation from geocentric coordinates to local coordinates.

>   > **Return type**
>   > *[Metashape.Matrix](#)*

name
>   Name of the coordinate system.

>   > **Type**
>   > str

proj4
>   Coordinate system definition in PROJ.4 format.

>   > **Type**
>   > str

project(*point*)
>   Projects point from geocentric coordinates to projected geographic coordinate system.

>   > **Parameters**
>   > **point** (`Metashape.Vector`) – 3D point in geocentric coordinates.

>   > **Returns**
>   > 3D point in projected coordinates.

>   > **Return type**
>   > *[Metashape.Vector](#)*

towgs84

TOWGS84 transformation parameters (dx, dy, dz, rx, ry, rz, scale).

> **Type**
> list[float]

transform(*point*, *source*, *target*)

Transform point coordinates between coordinate systems.

> **Parameters**
>
> - **point** ([`Metashape.Vector`]) – 2D or 3D point coordinates.
>
> - **source** ([`Metashape.CoordinateSystem`]) – Source coordinate system.
>
> - **target** ([`Metashape.CoordinateSystem`]) – Target coordinate system.
>
> **Returns**
> Transformed point coordinates.
>
> **Return type**
> *[Metashape.Vector](#)*

transformationMatrix(*point*, *source*, *target*)

Local approximation of coordinate transformation from source to target coordinate system at the given point.

> **Parameters**
>
> - **point** ([`Metashape.Vector`]) – 3D point coordinates.
>
> - **source** ([`Metashape.CoordinateSystem`]) – Source coordinate system.
>
> - **target** ([`Metashape.CoordinateSystem`]) – Target coordinate system.
>
> **Returns**
> 4x4 transformation matrix.
>
> **Return type**
> *[Metashape.Matrix](#)*

unproject(*point*)

Unprojects point from projected coordinates to geocentric coordinates.

> **Parameters**
> **point** ([`Metashape.Vector`]) – 3D point in projected coordinate system.
>
> **Returns**
> 3D point in geocentric coordinates.
>
> **Return type**
> *[Metashape.Vector](#)*

wkt

Coordinate system definition in WKT format.

> **Type**
> str

wkt2

Coordinate system definition in WKT format, version 2.

> **Type**
> str

class Metashape.**DataSource**

　　Data source in [TiePointsData, PointCloudData, ModelData, TiledModelData, ElevationData, OrthomosaicData, DepthMapsData, ImagesData, TrajectoryData, LaserScansData, DepthMapsAndLaserScansData]

class Metashape.**DataType**

　　Data type in [DataTypeUndefined, DataType8i, DataType8u, DataType16i, DataType16u, DataType16f, DataType32i, DataType32u, DataType32f, DataType64i, DataType64u, DataType64f]

class Metashape.**DepthMap**

　　Depth map data.

　　calibration

　　　　Depth map calibration.

　　　　　　Type

　　　　　　　　Metashape.Calibration

　　copy()

　　　　Returns a copy of the depth map.

　　　　　　Returns

　　　　　　　　Copy of the depth map.

　　　　　　Return type

　　　　　　　　Metashape.DepthMap

　　getCalibration(*level=0*)

　　　　Returns calibration data.

　　　　　　Parameters

　　　　　　　　level (*int*) – Level index.

　　　　　　Returns

　　　　　　　　Calibration data.

　　　　　　Return type

　　　　　　　　Metashape.Calibration

　　image($\big[$*level*$\big]$)

　　　　Returns image data.

　　　　　　Parameters

　　　　　　　　level (*int*) – Level index.

　　　　　　Returns

　　　　　　　　Image data.

　　　　　　Return type

　　　　　　　　Metashape.Image

　　setCalibration(*calibration*, *level=0*)

　　　　　　Parameters

　　　　　　　　• **calibration** (`Metashape.Calibration`) – Calibration data.

　　　　　　　　• **level** (*int*) – Level index.

　　setImage(*image*, *level=0*)

　　　　　　Parameters

　　　　　　　　• **image** (`Metashape.Image`) – Image object with depth map data.

> • **level** (*int*) – Level index.

class Metashape.**DepthMaps**

>A set of depth maps generated for a chunk frame.

>**clear()**
>>Clears depth maps data.

>**copy()**
>>Create a copy of the depth maps.

>>>**Returns**
>>>>Copy of the depth maps.

>>>**Return type**
>>>>*Metashape.DepthMaps*

>**items()**
>>List of items.

>**key**
>>Depth maps identifier.

>>>**Type**
>>>>int

>**keys()**
>>List of item keys.

>**label**
>>Depth maps label.

>>>**Type**
>>>>str

>**meta**
>>Depth maps meta data.

>>>**Type**
>>>>*Metashape.MetaData*

>**modified**
>>Modified flag.

>>>**Type**
>>>>bool

>**values()**
>>List of item values.

class Metashape.**Document**

>Metashape project.

>Contains list of chunks available in the project. Implements processing operations that work with multiple chunks. Supports saving/loading project files.

>The project currently opened in Metashape window can be accessed using Metashape.app.document attribute. Additional Document objects can be created as needed.

>The following example saves active chunk from the opened project in a separate project:

```
>>> import Metashape
>>> doc = Metashape.app.document
>>> doc.save(path = "project.psz", chunks = [doc.chunk])
```

addChunk()

> Add new chunk to the document.
>
> > **Returns**
> >> Created chunk.
> >
> > **Return type**
> >> *Metashape.Chunk*

alignChunks($\big[$*chunks*$\big]\big[$*, reference*$\big]$*, method=0*, *fit_scale=True*, *downscale=1*, *generic_preselection=False*, *filter_mask=False*, *mask_tiepoints=False*, *keypoint_limit=40000*$\big[$*, markers*$\big]\big[$*, progress*$\big]$)

> Align specified set of chunks.
>
> > **Parameters**
> >
> > - **chunks** (`list[int]`) – List of chunks to be aligned.
> >
> > - **reference** (`int`) – Chunk to be used as a reference.
> >
> > - **method** (`int`) – Alignment method (0 - point based, 1 - marker based, 2 - camera based).
> >
> > - **fit_scale** (`bool`) – Fit chunk scale during alignment.
> >
> > - **downscale** (`int`) – Alignment accuracy (0 - Highest, 1 - High, 2 - Medium, 4 - Low, 8 - Lowest).
> >
> > - **generic_preselection** (`bool`) – Enables image pair preselection.
> >
> > - **filter_mask** (`bool`) – Filter points by mask.
> >
> > - **mask_tiepoints** (`bool`) – Apply mask filter to tie points.
> >
> > - **keypoint_limit** (`int`) – Maximum number of points for each photo.
> >
> > - **markers** (`list[int]`) – List of markers to be used for marker based alignment.
> >
> > - **progress** (`Callable[[float], None]`) – Progress callback.

append(*document*$\big[$*, chunks*$\big]\big[$*, progress*$\big]$)

> Append the specified Document object to the current document.
>
> > **Parameters**
> >
> > - **document** (`Metashape.Document`) – Document object to be appended.
> >
> > - **chunks** (`list[Metashape.Chunk]`) – List of chunks to append.
> >
> > - **progress** (`Callable[[float], None]`) – Progress callback.

chunk

> Active chunk.
>
> > **Type**
> >> *Metashape.Chunk*

chunks

> List of chunks in the document.
>
> > **Type**
> >> list[*Metashape.Chunk*]

clear()

> Clear the contents of the Document object.

copy()

> Return a copy of the document.

> > **Returns**
> >
> > > A copy of the document.
> >
> > **Return type**
> >
> > > *Metashape.Document*

findChunk(*key*)

> Find chunk by its key.

> > **Returns**
> >
> > > Found chunk.
> >
> > **Return type**
> >
> > > *Metashape.Chunk*

mergeChunks(*copy_laser_scans=True*, *copy_depth_maps=False*, *copy_point_clouds=False*, *copy_models=False*, *copy_tiled_models=False*, *copy_elevations=False*, *copy_orthomosaics=False*, *merge_markers=False*, *merge_tiepoints=False*, *merge_assets=False*[, *chunks*][, *progress*])

> Merge specified set of chunks.

> > **Parameters**
> >
> > - **copy_laser_scans** (*bool*) – Copy laser scans.
> >
> > - **copy_depth_maps** (*bool*) – Copy depth maps.
> >
> > - **copy_point_clouds** (*bool*) – Copy point clouds.
> >
> > - **copy_models** (*bool*) – Copy models.
> >
> > - **copy_tiled_models** (*bool*) – Copy tiled models.
> >
> > - **copy_elevations** (*bool*) – Copy DEMs.

modified

> Modified flag.

> > **Type**
> >
> > > bool

open(*path*, *read_only=False*, *ignore_lock=False*, *archive=True*)

    Load document from the specified file.

        Parameters

- **path** (`str`) – Path to the file.

- **read_only** (`bool`) – Open document in read-only mode.

- **ignore_lock** (`bool`) – Ignore lock state for project modifications.

- **archive** (`bool`) – Override project format when using non-standard file extension.

path

    Path to the document file.

        Type

            str

read_only

    Read only status.

        Type

            bool

remove(*items*)

    Remove a set of items from the document.

        Parameters

            items (`list[Metashape.Chunk]`) – A list of items to be removed.

save([*path*][, *chunks*][, *version*], *archive=True*)

    Save document to the specified file.

        Parameters

- **path** (`str`) – Optional path to the file.

- **chunks** (`list[Metashape.Chunk]`) – List of chunks to be saved.

- **version** (`str`) – Project version to save.

- **archive** (`bool`) – Override project format when using non-standard file extension.

sortChunks()

    Sorts chunks by their labels.

class `Metashape.`**Elevation**

    Digital elevation model.

altitude(*point*)

    Return elevation value at the specified point.

        Parameters

            point (`Metashape.Vector`) – Point coordinates in the elevation coordinate system.

        Returns

            Elevation value.

        Return type

            float

bottom
>   Y coordinate of the bottom side.
>
> > **Type**
> >   float

clear()
>   Clears elevation model data.

copy()
>   Create a copy of the elevation model.
>
> > **Returns**
> >   Copy of the elevation model.
> >
> > **Return type**
> >   *Metashape.Elevation*

crs
>   Coordinate system of elevation model.
>
> > **Type**
> >   *Metashape.CoordinateSystem*

height
>   Elevation model height.

pickPoint(*origin*, *target*)
>   Returns ray intersection with the DEM (point on the ray nearest to some point).

>   > **Parameters**
>   >   - **origin** (`Metashape.Vector`) – Ray origin in the DEM coordinate system.
>   >   - **target** (`Metashape.Vector`) – Point on the ray in the DEM coordinate system.

>   > **Returns**
>   >   Coordinates of the intersection point in the DEM coordinate system.

>   > **Return type**
>   >   *Metashape.Vector*

projection
>   Projection of elevation model.

>   > **Type**
>   >   *Metashape.OrthoProjection*

resolution
>   DEM resolution in meters.

>   > **Type**
>   >   float

right
>   X coordinate of the right side.

>   > **Type**
>   >   float

top
>   Y coordinate of the top side.

>   > **Type**
>   >   float

width
>   Elevation model width.

>   > **Type**
>   >   int

class Metashape.**EulerAngles**

Euler angles in [EulerAnglesYPR, EulerAnglesOPK, EulerAnglesPOK, EulerAnglesANK]

class Metashape.**FaceCount**

Face count in [LowFaceCount, MediumFaceCount, HighFaceCount, CustomFaceCount]

class Metashape.**FilterMode**

Depth filtering mode in [NoFiltering, MildFiltering, ModerateFiltering, AggressiveFiltering]

class Metashape.**FrameStep**

Frame step size for video import in [CustomFrameStep, SmallFrameStep, MediumFrameStep, LargeFrameStep]

class Metashape.**Geometry**

Geometry data.

GeometryCollection(*geometries*)

Create a GeometryCollection geometry.

> **Parameters**
> geometries (*list[*Metashape.Geometry*]*) – Child geometries.

> **Returns**
> A GeometryCollection geometry.

> **Return type**
> *Metashape.Geometry*

LineString(*coordinates*)

Create a LineString geometry.

> **Parameters**
> coordinates (*list[*Metashape.Vector*]*) – List of vertex coordinates.

> **Returns**
> A LineString geometry.

> **Return type**
> *Metashape.Geometry*

MultiLineString(*geometries*)

Create a MultiLineString geometry.

> **Parameters**
> geometries (*list[*Metashape.Geometry*]*) – Child line strings.

> **Returns**
> A point geometry.

> **Return type**
> *Metashape.Geometry*

MultiPoint(*geometries*)

Create a MultiPoint geometry.

> **Parameters**
> geometries (*list[*Metashape.Geometry*]*) – Child points.

> **Returns**
> A point geometry.

> **Return type**
> *Metashape.Geometry*

MultiPolygon(*geometries*)

    Create a MultiPolygon geometry.

        Parameters

            geometries (`list[`*Metashape.Geometry*`]`) – Child polygons.

        Returns

            A point geometry.

        Return type

            [Metashape.Geometry](#)

Point(*vector*)

    Create a Point geometry.

        Parameters

            vector (`Metashape.Vector | list[float]`) – Point coordinates.

        Returns

            A point geometry.

        Return type

            [Metashape.Geometry](#)

Polygon(*exterior_ring*[, *interior_rings*])

    Create a Polygon geometry.

        Parameters

            • **exterior_ring** (`list[`*Metashape.Vector*`]`) – Point coordinates.

            • **interior_rings** (`list[`*Metashape.Vector*`]`) – Point coordinates.

        Returns

            A Polygon geometry.

        Return type

            [Metashape.Geometry](#)

class Type

    Geometry type in [PointType, LineStringType, PolygonType, MultiPointType, MultiLineStringType, MultiPolygonType, GeometryCollectionType]

coordinates

    List of vertex coordinates.

        Type

            list[*[Metashape.Vector](#)*]

geometries

    List of child geometries.

        Type

            list[*[Metashape.Geometry](#)*]

is_3d

    Is 3D flag.

        Type

            bool

type

> Geometry type.
>
> > **Type**
> > *Metashape.Geometry.Type*

class Metashape.**Image**(*width*, *height*, *channels*, *datatype='U8'*)

> n-channel image
>
> > **Parameters**
> >
> > - **width** (*int*) – image width
> >
> > - **height** (*int*) – image height
> >
> > - **channels** (*str*) – color channel layout, e.g. 'RGB', 'RGBA', etc.
> >
> > - **datatype** (*str*) – pixel data type in ['U8', 'U16', 'U32', 'F16', 'F32', 'F64']

channels

> Channel mapping for the image.
>
> > **Type**
> > str

cn

> Number of color channels.
>
> > **Type**
> > int

convert(*channels*[, *datatype*])

> Convert image to specified data type and channel layout.
>
> > **Parameters**
> >
> > - **channels** (*str*) – color channels to be loaded, e.g. 'RGB', 'RGBA', etc.
> >
> > - **datatype** (*str*) – pixel data type in ['U8', 'U16', 'U32', 'F16', 'F32', 'F64']
> >
> > **Returns**
> > Converted image.
> >
> > **Return type**
> > *Metashape.Image*

copy()

> Return a copy of the image.
>
> > **Returns**
> > copy of the image
> >
> > **Return type**
> > *Metashape.Image*

data_type

> Data type used to store pixel values.
>
> > **Type**
> > str

fromstring(*data*, *width*, *height*, *channels*, *datatype='U8'*)

>   Create image from byte array.

>   **Parameters**

>> • **data** (*str*) – raw image data

>> • **width** (*int*) – image width

>> • **height** (*int*) – image height

>> • **channels** (*str*) – color channel layout, e.g. 'RGB', 'RGBA', etc.

>> • **datatype** (*str*) – pixel data type in ['U8', 'U16', 'U32', 'F16', 'F32', 'F64']

>   **Returns**

>>   Created image.

>   **Return type**

>>   *[Metashape.Image](#)*

gaussianBlur(*radius*)

>   Smooth image with a gaussian filter.

>   **Parameters**

>>   **radius** (*float*) – smoothing radius.

>   **Returns**

>>   Smoothed image.

>   **Return type**

>>   *[Metashape.Image](#)*

height

>   Image height.

>   **Type**

>>   int

open(*path*, *layer=0*, *datatype='U8'*[, *channels*ﾠ][, *x*ﾠ][, *y*ﾠ][, *w*ﾠ][, *h*ﾠ])

>   Load image from file.

>   **Parameters**

>> • **path** (*str*) – path to the image file

>> • **layer** (*int*) – image layer in case of multipage file

>> • **datatype** (*str*) – pixel data type in ['U8', 'U16', 'U32', 'F16', 'F32', 'F64']

>> • **channels** (*str*) – color channels to be loaded, e.g. 'RGB', 'RGBA', etc.

>> • **x** (*int*) – x offset of image region.

>> • **y** (*int*) – y offset of image region.

>> • **w** (*int*) – width of image region.

>> • **h** (*int*) – height of image region.

>   **Returns**

>>   Loaded image.

>   **Return type**

>>   *[Metashape.Image](#)*

resize(*width*, *height*)

Resize image to specified dimensions.

> **Parameters**
> - **width** (*int*) – new image width
> - **height** (*int*) – new image height
>
> **Returns**
> resized image
>
> **Return type**
> *[Metashape.Image](#)*

save(*path*[, *compression*])

Save image to the file.

> **Parameters**
> - **path** (*str*) – path to the image file
> - **compression** ([Metashape.ImageCompression](#)) – compression options

tostring()

Convert image to byte array.

> **Returns**
> Raw image data.
>
> **Return type**
> str

undistort(*calib*, *center_principal_point=True*, *square_pixels=True*)

Undistort image using provided calibration.

> **Parameters**
> - **calib** ([Metashape.Calibration](#)) – lens calibration
> - **center_principal_point** (*bool*) – moves principal point to the image center
> - **square_pixels** (*bool*) – create image with square pixels
>
> **Returns**
> undistorted image
>
> **Return type**
> *[Metashape.Image](#)*

uniformNoise(*amplitude*)

Add uniform noise with specified amplitude.

> **Parameters**
> **amplitude** (*float*) – noise amplitude.
>
> **Returns**
> Image with added noise.
>
> **Return type**
> *[Metashape.Image](#)*

warp(*calib0*, *trans0*, *calib1*, *trans1*)

    Warp image by rotating virtual viewpoint.

        Parameters

- **calib0** (`Metashape.Calibration`) – initial calibration

- **trans0** (`Metashape.Matrix`) – initial camera orientation as 4x4 matrix

- **calib1** (`Metashape.Calibration`) – final calibration

- **trans1** (`Metashape.Matrix`) – final camera orientation as 4x4 matrix

        Returns

            warped image

        Return type

            Metashape.Image

width

    Image width.

        Type

            int

class Metashape.**ImageCompression**

    Image compression parameters

    class TiffCompression

        Tiff compression in [TiffCompressionNone, TiffCompressionLZW, TiffCompressionJPEG, TiffCompressionPackbits, TiffCompressionDeflate]

    copy()

        Return a copy of the object.

        Returns

            A copy of the object.

        Return type

            Metashape.Viewpoint

jpeg_quality

    JPEG quality.

        Type

            int

tiff_big

    Enable BigTIFF compression for TIFF files.

        Type

            bool

tiff_compression

    Tiff compression.

        Type

            int

tiff_overviews

    Enable image pyramid deneration for TIFF files.

> > **Type**
> > bool

tiff_tiled

> Export tiled TIFF.

> > **Type**
> > bool

class Metashape.**ImageFormat**

> Image format in [ImageFormatNone, ImageFormatJPEG, ImageFormatTIFF, ImageFormatPNG, ImageFormatBMP, ImageFormatEXR, ImageFormatPNM, ImageFormatSGI, ImageFormatCR2, ImageFormatBZ2, ImageFormatSEQ, ImageFormatBIL, ImageFormatASCII, ImageFormatXYZ, ImageFormatARA, ImageFormatTGA, ImageFormatDDS, ImageFormatJP2, ImageFormatWebP, ImageFormatJXL, ImageFormatKTX]

class Metashape.**ImageLayout**

> Image layout in [UndefinedLayout, FlatLayout, MultiframeLayout, MultiplaneLayout]

class Metashape.**Interpolation**

> Interpolation mode in [DisabledInterpolation, EnabledInterpolation, Extrapolated]

class Metashape.**License**

> License information.

> **activate**(*license_key*)

> > Activate software online using a license key.

> > > **Parameters**
> > > **key** (*str*) – Activation key.

> **activateOffline**(*activation_params*)

> > Create a request for offline activation.

> > > **Parameters**
> > > **activation_params** (*str*) – The content of .actparam file.

> > > **Returns**
> > > The activation request which should be saved to .actreq file.

> > > **Return type**
> > > str

> **borrowLicense**(*seconds*)

> > Borrow floating license for the specified number of seconds.

> > > **Parameters**
> > > **seconds** (*int*) – Borrow duration in seconds.

> **deactivate**()

> > Deactivate software online.

> **deactivateOffline**()

> > Create a request for offline deactivation.

> > > **Returns**
> > > The deactivation request which should be saved to .actreq file.

> > > **Return type**
> > > str

expiration

License expiration as a Unix timestamp in seconds.

> **Type**
>> int

install(*activation_response*)

Install license from the activation response.

> **Parameters**
>> **activation_response** (*str*) – The content of .actresp file.

returnLicense()

Return borrowed license to the license server.

valid

Metashape activation status.

> **Type**
>> bool

class Metashape.**MappingMode**

UV mapping mode in [GenericMapping, OrthophotoMapping, AdaptiveOrthophotoMapping, SphericalMapping, CameraMapping]

class Metashape.**Marker**

Marker instance

class Projection

Marker data().

coord

Point coordinates in pixels.
> **Type**
>> *Metashape.Vector*

pinned

Pinned flag.
> **Type**
>> bool

valid

Valid flag.
> **Type**
>> bool

class Projections

Collection of projections specified for the marker

items()

List of items.

keys()

List of item keys.

values()

List of item values.

---

class Reference

> Marker reference data.

> **accuracy**
>

clear()

> Clears model data.

closeHoles(*level=30*, *apply_to_selection=False*)

> Fill holes in the model surface.
>
> > **Parameters**
> >
> > - **level** (*int*) – Hole size threshold in percents.
> >
> > - **apply_to_selection** (*bool*) – Close holes within selection

copy()

> Create a copy of the model.
>
> > **Returns**
> > > Copy of the model.
> >
> > **Return type**
> > > *[Metashape.Model](#)*

cropSelection()

> Crop selected faces and free vertices from the mesh.

crs

> Reference coordinate system.
>
> > **Type**
> > > *[Metashape.CoordinateSystem](#)* | None

data_type

> Data type used to store color values.
>
> > **Type**
> > > *[Metashape.DataType](#)*

faces

Collection of model faces.

> **Type**
>> *Metashape.Model.Faces*

fixTopology()

Remove polygons causing topological problems.

getActiveTexture(*type=Model.DiffuseMap*)

Return active texture.

> **Parameters**
>> **type** (Metashape.Model.TextureType) – Texture type.

> **Returns**
>> Texture image.

> **Return type**
>> *Metashape.Image*

group

Model group.

> **Type**
>> *Metashape.ModelGroup*

key

Model identifier.

> **Type**
>> int

label

Model label.

> **Type**
>> str

loadTexture(*path*)

Load texture from the specified file.

> **Parameters**
>> **path** (*str*) – Path to the image file.

meta

Model meta data.

> **Type**
>> *Metashape.MetaData*

modified

Modified flag.

> **Type**
>> bool

pickPoint(*origin*, *target*, *endpoints=1*)

Return ray intersection with mesh.

> **Parameters**

- **origin** ([Metashape.Vector](#)) – Ray origin.

- **target** ([Metashape.Vector](#)) – Point on the ray.

- **endpoints** (*int*) – Number of endpoints to check for (0 - line, 1 - ray, 2 - segment).

> **Returns**
> Coordinates of the intersection point.

> **Return type**
> *[Metashape.Vector](#)*

remove(*items*)

Remove textures from the model.

> **Parameters**
> **items** (*list[[Metashape.Model.Texture](#)]*) – A list of textures to be removed.

removeComponents(*size*)

Remove small connected components.

> **Parameters**
> **size** (*int*) – Threshold on the polygon count of the components to be removed.

removeSelection()

Remove selected faces and free vertices from the mesh.

removeTextures()

Remove textures.

removeUV()

Remove UV mapping.

removeVertexColors()

Remove vertex colors.

removeVertexConfidence()

Remove confidence.

renderDepth(*transform*, *calibration*, *cull_faces=True*, *add_alpha=True*)

Render model depth image for specified viewpoint.

> **Parameters**
>
> - **transform** ([Metashape.Matrix](#)) – Camera location.
>
> - **calibration** ([Metashape.Calibration](#)) – Camera calibration.
>
> - **cull_faces** (*bool*) – Enable back-face culling.
>
> - **add_alpha** (*bool*) – Generate image with alpha channel.
>
> **Returns**
> Rendered image.
>
> **Return type**
> *[Metashape.Image](#)*

renderImage(*transform*, *calibration*, *cull_faces=True*, *add_alpha=True*, *raster_transform=RasterTransformNone*)

Render model image for specified viewpoint.

> **Parameters**

- **transform** (`Metashape.Matrix`) – Camera location.

- **calibration** (`Metashape.Calibration`) – Camera calibration.

- **cull_faces** (`bool`) – Enable back-face culling.

- **add_alpha** (`bool`) – Generate image with alpha channel.

- **raster_transform** (`Metashape.RasterTransformType`) – Raster band transformation.

    Returns
        Rendered image.

    Return type
        Metashape.Image

renderMask(*transform*, *calibration*, *cull_faces=True*)

   Render model mask image for specified viewpoint.

    Parameters

- **transform** (`Metashape.Matrix`) – Camera location.

- **calibration** (`Metashape.Calibration`) – Camera calibration.

- **cull_faces** (`bool`) – Enable back-face culling.

    Returns
        Rendered image.

    Return type
        Metashape.Image

renderNormalMap(*transform*, *calibration*, *cull_faces=True*, *add_alpha=True*)

   Render image with model normals for specified viewpoint.

    Parameters

- **transform** (`Metashape.Matrix`) – Camera location.

- **calibration** (`Metashape.Calibration`) – Camera calibration.

- **cull_faces** (`bool`) – Enable back-face culling.

- **add_alpha** (`bool`) – Generate image with alpha channel.

    Returns
        Rendered image.

    Return type
        Metashape.Image

renderPreview(*width = 2048*, *height = 2048*[, *transform*][, *progress*])

   Generate model preview image.

    Parameters

- **width** (`int`) – Preview image width.

- **height** (`int`) – Preview image height.

- **transform** (`Metashape.Matrix`) – 4x4 viewpoint transformation matrix.

- **progress** (`Callable[[float], None]`) – Progress callback.

> **Returns**
> Preview image.
>
> **Return type**
> *[Metashape.Image](#)*

saveTexture(*path*)

> Save texture to the specified file.
>
> **Parameters**
> **path** (`str`) – Path to the image file.

setActiveTexture(*texture*, *type=Model.DiffuseMap*)

> Set active texture.
>
> **Parameters**
> - **texture** ([`Metashape.Model.Texture`](#)) – Texture to set.
> - **type** ([`Metashape.Model.TextureType`](#)) – Texture type.

setVertexColors(*channels='RGB'*, *datatype='U8'*)

> Clear vertex colors data and set layout.
>
> **Parameters**
> - **channels** (`str`) – color channel layout, e.g. 'RGB', 'RGBA', etc.
> - **datatype** (`str`) – pixel data type in ['U8', 'U16', 'U32', 'F16', 'F32', 'F64']

statistics([*progress*])

> Return model statistics.
>
> **Parameters**
> **progress** (`Callable[[float], None]`) – Progress callback.
>
> **Returns**
> Model statistics.
>
> **Return type**
> *[Metashape.Model.Statistics](#)*

tex_vertices

> Collection of model texture vertices.
>
> **Type**
> *[Metashape.Model.TexVertices](#)*

textures

> List of model textures.
>
> **Type**
> list[*[Metashape.Model.Texture](#)*]

transform

> 4x4 model transformation matrix.
>
> **Type**
> *[Metashape.Matrix](#)*

transformVertices(*transform*)

> Transform vertex coordinates.

> **Parameters**
> **transform** (`Metashape.Matrix`) – 4x4 transformation matrix.

vertices

> Collection of model vertices.
>
> > **Type**
> > *Metashape.Model.Vertices*

volume()

> Return volume of the closed model surface.
>
> > **Returns**
> > Model volume.
>
> > **Return type**
> > float

class Metashape.**ModelFormat**

> Model format in [ModelFormatNone, ModelFormatOBJ, ModelFormat3DS, ModelFormatVRML, ModelFormatPLY, ModelFormatCOLLADA, ModelFormatU3D, ModelFormatPDF, ModelFormatDXF, ModelFormatFBX, ModelFormatKMZ, ModelFormatCTM, ModelFormatSTL, ModelFormatDXF_3DF, ModelFormatTLS, ModelFormatABC, ModelFormatOSGB, ModelFormatOSGT, ModelFormatGLTF, ModelFormatX3D, ModelFormatLandXML]

class Metashape.**ModelGroup**

> ModelGroup objects define groups of multiple models. The grouping is established by assignment of a ModelGroup instance to the Model.group attribute of participating models.

key

> Model group identifier.
>
> > **Type**
> > int

label

> Model group label.
>
> > **Type**
> > str

meta

> Model group meta data.
>
> > **Type**
> > *Metashape.MetaData*

selected

> Current selection state.
>
> > **Type**
> > bool

class Metashape.**NetworkClient**

> NetworkClient class provides access to the network processing server and allows to create and manage tasks.
>
> The following example connects to the server and lists active tasks:

```
>>> import Metashape
>>> client = Metashape.NetworkClient()
>>> client.connect('127.0.0.1')
>>> client.batchList()
```

abortBatch(*batch_id*)

> Abort batch.
>
> > **Parameters**
> > > **batch_id** (*int*) – Batch id.

abortWorker(*worker_id*)

> Abort worker.
>
> > **Parameters**
> > > **worker_id** (*int*) – Worker id.

batchInfo(*batch_id*, *revision=0*)

> Get batch information.
>
> > **Parameters**
> >
> > > • **batch_id** (*int*) – Batch id.
> > >
> > > • **revision** (*int*) – First revision to get.
> >
> > **Returns**
> > > Batch information.
> >
> > **Return type**
> > > dict

batchList(*revision=0*)

> Get list of batches.
>
> > **Parameters**
> > > **revision** (*int*) – First revision to get.
> >
> > **Returns**
> > > List of batches.
> >
> > **Return type**
> > > dict

connect(*host*, *port=5840*)

> Connect to the server.
>
> > **Parameters**
> >
> > > • **host** (*str*) – Server hostname.
> > >
> > > • **port** (*int*) – Communication port.

createBatch(*path*, *tasks*[, *meta*])

> Create new batch.
>
> > **Parameters**
> >
> > > • **path** (*str*) – Project path relative to root folder.
> > >
> > > • **tasks** (*list[*Metashape.NetworkTask*]*) – List of processing tasks to execute.
> > >
> > > • **meta** (Metashape.MetaData) – Batch metadata.

Returns
Batch id.

Return type
int

disconnect()
Disconnect from the server.

exportBatches([*batch_ids*])
Export current state of batches.

Parameters
batch_ids (`list[int]`) – List of batch ids to export.

Returns
Batches data.

Return type
str

findBatch(*path*)
Get batch id based on project path.

Parameters
path (`str`) – Project path relative to root folder.

Returns
Batch id.

Return type
int

importBatches(*data*)
Import batches from exported data.

Parameters
data (`str`) – Batches data.

quitWorker(*worker_id*)
Quit worker.

Parameters
worker_id (`int`) – Worker id.

serverInfo(*revision=0*)
Get server information.

Parameters
revision (`int`) – First revision to get.

Returns
Server information.

Return type
dict

serverVersion()
Get server version.

Returns
Server version.

> **Return type**
> dict

setBatchPaused(*batch_id*, *paused=True*)

Set batch paused state.

> **Parameters**
>
> - **batch_id** (`int`) – Batch id.
>
> - **paused** (`bool`) – Paused state.

setBatchPriority(*batch_id*, *priority*)

Set batch priority.

> **Parameters**
>
> - **batch_id** (`int`) – Batch id.
>
> - **priority** (`int`) – Batch priority (2 - Highest, 1 - High, 0 - Normal, -1 - Low, -2 - Lowest).

setBatchWorkerLimit(*batch_id*, *worker_limit*)

Set worker limit of the batch.

> **Parameters**
>
> - **batch_id** (`int`) – Batch id.
>
> - **worker_limit** (`int`) – Worker limit of the batch (0 - unlimited).

setMasterServer([*host*])

Set or reset master server.

> **Parameters**
> **host** (`str`) – Master server hostname.

setWorkerCapability(*worker_id*, *capability*)

Set worker capability.

> **Parameters**
>
> - **worker_id** (`int`) – Worker id.
>
> - **capability** (`int`) – Worker capability (1 - CPU, 2 - GPU, 3 - Any).

setWorkerCpuEnabled(*worker_id*, *cpu_enabled*)

Set worker CPU enabled flag.

> **Parameters**
>
> - **worker_id** (`int`) – Worker id.
>
> - **cpu_enabled** (`bool`) – CPU enabled flag.

setWorkerGpuMask(*worker_id*, *gpu_mask*)

Set worker GPU mask.

> **Parameters**
>
> - **worker_id** (`int`) – Worker id.
>
> - **gpu_mask** (`int`) – GPU device mask.

setWorkerPaused(*worker_id*, *paused=True*)

    Set worker paused state.

        Parameters

- **worker_id** (*int*) – Worker id.

- **paused** (*bool*) – Paused state.

setWorkerPriority(*worker_id*, *priority*)

    Set worker priority.

        Parameters

- **worker_id** (*int*) – Worker id.

- **priority** (*int*) – Worker priority (2 - Highest, 1 - High, 0 - Normal, -1 - Low, -2 - Lowest).

workerInfo(*worker_id*, *revision=0*)

    Get worker information.

        Parameters

- **worker_id** (*int*) – Worker id.

- **revision** (*int*) – First revision to get.

        Returns

            Worker information.

        Return type

            dict

workerList(*revision=0*)

    Get list of workers.

        Parameters

            revision (*int*) – First revision to get.

        Returns

            List of workers.

        Return type

            dict

class Metashape.**NetworkTask**

    NetworkTask class contains information about network task and its parameters.

    The following example creates a new processing task and submits it to the server:

```
>>> import Metashape
>>> task = Metashape.NetworkTask()
>>> task.name = 'MatchPhotos'
>>> task.params['keypoint_limit'] = 40000
>>> client = Metashape.NetworkClient()
>>> client.connect('127.0.0.1')
>>> batch_id = client.createBatch('processing/project.psx', [task])
>>> client.setBatchPaused(batch_id, false)
```

chunks

    List of chunks.

> **Type**
>> list

encode()
> Create a dictionary with task parameters.

frames
> List of frames.

> **Type**
>> list

gpu_support
> GPU support flag.

> **Type**
>> bool

name
> Task name.

> **Type**
>> str

params
> Task parameters.

> **Type**
>> dict

class Metashape.**OrthoProjection**
> Orthographic projection.

class Type
> Projection type in [Planar, Cylindrical]

copy()
> Return a copy of the object.

> **Returns**
>> A copy of the object.

> **Return type**
>> *[Metashape.OrthoProjection](#)*

crs
> Base coordinate system.

> **Type**
>> *[Metashape.CoordinateSystem](#)*

matrix
> Ortho transformation matrix.

> **Type**
>> *[Metashape.Matrix](#)*

radius
> Cylindrical projection radius.

> **Type**
>> float

transform(*point*, *source*, *target*)

Transform point coordinates between coordinate systems.

> **Parameters**
>
> - **point** (Metashape.Vector) – 2D or 3D point coordinates.
> - **source** (Metashape.OrthoProjection / Metashape.CoordinateSystem) – Source coordinate system.
> - **target** (Metashape.OrthoProjection / Metashape.CoordinateSystem) – Target coordinate system.
>
> **Returns**
> Transformed point coordinates.
>
> **Return type**
> *Metashape.Vector*

type

Projection type.

> **Type**
> *Metashape.OrthoProjection.Type*

class Metashape.**Orthomosaic**

Orthomosaic data.

The following sample assigns to the first shape in the chunk the image from the first camera for the orthomosaic patch and updates the mosaic:

```
>>> import Metashape
>>> chunk = Metashape.app.document.chunk
>>> ortho = chunk.orthomosaic
>>> camera = chunk.cameras[0]
>>> shape = chunk.shapes[0]
>>> patch = Metashape.Orthomosaic.Patch()
>>> patch.image_keys = [camera.key]
>>> ortho.patches[shape] = patch
>>> ortho.update()
```

class Patch

Orthomosaic patch.

copy()

Returns a copy of the patch.

> **Returns**
> Copy of the patch.
> **Return type**
> *Metashape.Orthomosaic.Patch*

excluded

Excluded flag.

> **Type**
> bool

image_keys

Image keys.

> > > **Type**
> > > list[int]

class Patches

A set of orthomosaic patches.

items()

List of items.

keys()

List of item keys.

values()

List of item values.

bands

List of color bands.

> **Type**
> list[str]

bottom

Y coordinate of the bottom side.

> **Type**
> float

clear()

Clears orthomosaic data.

copy()

Create a copy of the orthomosaic.

> **Returns**
> Copy of the orthomosaic.

> **Return type**
> *Metashape.Orthomosaic*

crs

Coordinate system of orthomosaic.

> **Type**
> *Metashape.CoordinateSystem*

data_type

Data type used to store color values.

> **Type**
> *Metashape.DataType*

height

Orthomosaic height.

> **Type**
> int

key

Orthomosaic identifier.

> **Type**
>> int

label
> Orthomosaic label.
>
>> **Type**
>>> str

left
> X coordinate of the left side.
>
>> **Type**
>>> float

meta
> Orthomosaic meta data.
>
>> **Type**
>>> *[Metashape.MetaData](#)*

modified
> Modified flag.
>
>> **Type**
>>> bool

patches
> Orthomosaic patches.
>
>> **Type**
>>> *[Metashape.Orthomosaic.Patches](#)*

projection
> Orthomosaic projection.
>
>> **Type**
>>> *[Metashape.OrthoProjection](#)*

removeOrthophotos()
> Remove orthorectified images from orthomosaic.

renderPreview(*width = 2048*, *height = 2048*[, *progress*])
> Generate orthomosaic preview image.
>
>> **Parameters**
>>
>> - **width** (*int*) – Preview image width.
>>
>> - **height** (*int*) – Preview image height.
>>
>> - **progress** (*Callable[[float], None]*) – Progress callback.
>>
>> **Returns**
>>> Preview image.
>>
>> **Return type**
>>> *[Metashape.Image](#)*

reset([*progress*])
> Reset all edits to orthomosaic.

> **Parameters**
> > **progress** (`Callable[[float], None]`) – Progress callback.

resolution

> Orthomosaic resolution in meters.
>
> > **Type**
> > > float

right

> X coordinate of the right side.
>
> > **Type**
> > > float

top

> Y coordinate of the top side.
>
> > **Type**
> > > float

update([*progress*])

> Apply edits to orthomosaic.
>
> > **Parameters**
> > > **progress** (`Callable[[float], None]`) – Progress callback.

width

> Orthomosaic width.
>
> > **Type**
> > > int

class Metashape.**Photo**

> Photo instance

alpha()

> Returns alpha channel data.
>
> > **Returns**
> > > Alpha channel data.
> >
> > **Return type**
> > > *Metashape.Image*

copy()

> Returns a copy of the photo.
>
> > **Returns**
> > > Copy of the photo.
> >
> > **Return type**
> > > *Metashape.Photo*

image([*channels*][, *datatype*])

> Returns image data.
>
> > **Parameters**
> >
> > > • **datatype** (`str`) – pixel data type in ['U8', 'U16', 'U32', 'F16', 'F32', 'F64']
> > >
> > > • **channels** (`str`) – color channels to be loaded, e.g. 'RGB', 'RGBA', etc.

> **Returns**
> Image data.
>
> **Return type**
> *Metashape.Image*

imageMeta()

Returns image meta data.

> **Returns**
> Image meta data.
>
> **Return type**
> *Metashape.MetaData*

layer

Layer index in the image file.

> **Type**
> int

meta

Frame meta data.

> **Type**
> *Metashape.MetaData*

open(*path*, *layer=0*)

Loads specified image file.

> **Parameters**
> - **path** (*str*) – Path to the image file to be loaded.
> - **layer** (*int*) – Layer index in case of multipage files.

path

Path to the image file.

> **Type**
> str

thumbnail(*width=192*, *height=192*)

Creates new thumbnail with specified dimensions.

> **Returns**
> Thumbnail data.
>
> **Return type**
> *Metashape.Thumbnail*

class Metashape.**PointClass**

Point class in [Created, Unclassified, Ground, LowVegetation, MediumVegetation, HighVegetation, Building, LowPoint, ModelKeyPoint, Water, Rail, RoadSurface, OverlapPoints, WireGuard, WireConductor, TransmissionTower, WireConnector, BridgeDeck, HighNoise, Car, Manmade]

class Metashape.**PointCloud**

Point cloud data.

assignClass(*target=0*[, *source*][, *progress*])

Assign class to points.

Parameters

- **target** ([Metashape.PointClass](#)) – Target class.

- **source** ([Metashape.PointClass](#) | *list[*[Metashape.PointClass](#)*]*) – Classes of points to be replaced.

- **progress** (*Callable[[float], None]*) – Progress callback.

assignClassToSelection(*target=0*[, *source*][, *progress*])

Assign class to selected points.

Parameters

- **target** ([Metashape.PointClass](#)) – Target class.

- **source** ([Metashape.PointClass](#) | *list[*[Metashape.PointClass](#)*]*) – Classes of points to be replaced.

- **progress** (*Callable[[float], None]*) – Progress callback.

bands

List of color bands.

Type

list[str]

classifyGroundPoints(*max_angle=10.0*, *max_distance=1.0*, *max_terrain_slope=10.0*, *cell_size=50.0*, *erosion_radius=0.0*[, *source_class*][, *return_number*], *keep_existing=False*[, *progress*])

Classify points into ground and non ground classes.

Parameters

- **max_angle** (*float*) – Maximum angle (degrees).

- **max_distance** (*float*) – Maximum distance (meters).

- **max_terrain_slope** (*float*) – Maximum terrain slope angle (degrees).

- **cell_size** (*float*) – Cell size (meters).

- **erosion_radius** (*float*) – Erosion radius (meters).

- **source_class** ([Metashape.PointClass](#)) – Class of points to be re-classified.

- **return_number** (*int*) – Point return number to use (0 - any return, 1 - first return, -1 - last return).

- **keep_existing** (*bool*) – Keep existing ground points.

- **progress** (*Callable[[float], None]*) – Progress callback.

classifyPoints([*source*][, *target*], *confidence=0.0*[, *progress*])

Multiclass classification of points.

Parameters

- **source** ([Metashape.PointClass](#)) – Class of points to be re-classified.

- **target** (*list[*[Metashape.PointClass](#)*]*) – Target point classes for classification.

- **confidence** (*float*) – Required confidence level from 0.0 to 1.0.

- **progress** (*Callable[[float], None]*) – Progress callback.

clear()

>   Clears point cloud data.

compactPoints([*progress*])

>   Permanently removes deleted points from point cloud.

>   > **Parameters**
>   >
>   >   **progress** (`Callable[[float], None]`) – Progress callback.

component

>   Point cloud component.

modified

> Modified flag.

>> **Type**
>>> bool

pickPoint(*origin*, *target*, *endpoints=1*)

> Returns ray intersection with the point cloud (point on the ray nearest to some point).

>> **Parameters**
>>
>> - **origin** ([Metashape.Vector](#)) – Ray origin.
>>
>> - **target** ([Metashape.Vector](#)) – Point on the ray.
>>
>> - **endpoints** (*int*) – Number of endpoints to check for (0 - line, 1 - ray, 2 - segment).
>>
>> **Returns**
>>> Coordinates of the intersection point.
>>
>> **Return type**
>>> *[Metashape.Vector](#)*

point_count

> Number of points in point cloud.

>> **Type**
>>> int

removePoints(*point_classes*[, *progress*])

> Remove points.

>> **Parameters**
>>
>> - **point_classes** ([Metashape.PointClass](#) | *list[[Metashape.PointClass](#)]*) – Classes of points to be removed.
>>
>> - **progress** (*Callable[[float], None]*) – Progress callback.

removeSelectedPoints([*point_classes*][, *progress*])

> Remove selected points.

>> **Parameters**

- **point_classes** ([Metashape.PointClass] | *list[*[Metashape.PointClass]*]*) –
  Classes of points to be removed.

- **progress** (*Callable[[float], None]*) – Progress callback.

renderDepth(*transform*, *calibration*, *point_size=1*, *resolution=1*, *cull_points=False*, *add_alpha=True*)

    Render point cloud depth image for specified viewpoint.

    Parameters

- **transform** ([Metashape.Matrix]) – Camera location.

- **calibration** ([Metashape.Calibration]) – Camera calibration.

- **point_size** (*int*) – Point size.

- **resolution** (*float*) – Level of detail resolution in screen pixels.

- **cull_points** (*bool*) – Enable normal based culling.

- **add_alpha** (*bool*) – Generate image with alpha channel.

    Returns

    Rendered image.

    Return type

    [Metashape.Image]

renderImage(*transform*, *calibration*, *point_size=1*, *resolution=1*, *cull_points=False*, *add_alpha=True*,
    raster_transform=RasterTransformNone)

    Render point cloud image for specified viewpoint.

    Parameters

- **transform** ([Metashape.Matrix]) – Camera location.

- **calibration** ([Metashape.Calibration]) – Camera calibration.

- **point_size** (*int*) – Point size.

- **resolution** (*float*) – Level of detail resolution in screen pixels.

- **cull_points** (*bool*) – Enable normal based culling.

- **add_alpha** (*bool*) – Generate image with alpha channel.

- **raster_transform** ([Metashape.RasterTransformType]) – Raster band transforma-
  tion.

    Returns

    Rendered image.

    Return type

    [Metashape.Image]

renderMask(*transform*, *calibration*, *point_size=1*, *resolution=1*, *cull_points=False*)

    Render point cloud mask image for specified viewpoint.

    Parameters

- **transform** ([Metashape.Matrix]) – Camera location.

- **calibration** ([Metashape.Calibration]) – Camera calibration.

- **point_size** (*int*) – Point size.

- **resolution** (*float*) – Level of detail resolution in screen pixels.

> - **cull_points** (*bool*) – Enable normal based culling.

> **Returns**
>> Rendered image.

> **Return type**
>> *[Metashape.Image](#)*

renderNormalMap(*transform*, *calibration*, *point_size=1*, *resolution=1*, *cull_points=False*, *add_alpha=True*)

> Render image with point cloud normals for specified viewpoint.

> **Parameters**

>> - **transform** ([Metashape.Matrix](#)) – Camera location.

>> - **calibration** ([Metashape.Calibration](#)) – Camera calibration.

>> - **point_size** (*int*) – Point size.

>> - **resolution** (*float*) – Level of detail resolution in screen pixels.

>> - **cull_points** (*bool*) – Enable normal based culling.

>> - **add_alpha** (*bool*) – Generate image with alpha channel.

> **Returns**
>> Rendered image.

> **Return type**
>> *[Metashape.Image](#)*

renderPreview(*width = 2048*, *height = 2048*[, *transform*], *point_size=1*[, *progress*])

> Generate point cloud preview image.

> **Parameters**

>> - **width** (*int*) – Preview image width.

>> - **height** (*int*) – Preview image height.

>> - **transform** ([Metashape.Matrix](#)) – 4x4 viewpoint transformation matrix.

>> - **point_size** (*int*) – Point size.

>> - **progress** (*Callable[[float], None]*) – Progress callback.

> **Returns**
>> Preview image.

> **Return type**
>> *[Metashape.Image](#)*

resetFilters()

> Reset filters.

restorePoints([*point_classes*][, *progress*])

> Restore deleted points.

> **Parameters**

>> - **point_classes** ([Metashape.PointClass](#) | *list[[Metashape.PointClass](#)]*) – Classes of points to be restored.

>> - **progress** (*Callable[[float], None]*) – Progress callback.

selectMaskedPoints(*cameras*, *softness=4*[, *progress*])

> Select points based on image masks.
>
> > **Parameters**
> >
> > - **cameras** (`list[Metashape.Camera]`) – A list of cameras to use for selection.
> > - **softness** (`float`) – Mask edge softness.
> > - **progress** (`Callable[[float], None]`) – Progress callback.

selectPointsByColor(*color*, *tolerance=10*, *channels='RGB'*[, *progress*])

> Select points based on point colors.
>
> > **Parameters**
> >
> > - **color** (`list[int]`) – Color to select.
> > - **tolerance** (`int`) – Color tolerance.
> > - **channels** (`str`) – Combination of color channels to compare in ['R', 'G', 'B', 'H', 'S', 'V'].
> > - **progress** (`Callable[[float], None]`) – Progress callback.

selectPointsByShapes([*shapes*][, *progress*])

> Select points based on shapes.
>
> > **Parameters**
> >
> > - **shapes** (`list[Metashape.Shape]`) – A list of shapes to use for selection (selected shapes if not specified).
> > - **progress** (`Callable[[float], None]`) – Progress callback.

selected

> Selects/deselects the point cloud.
>
> > **Type**
> > bool

setClassesFilter(*point_classes*)

> Set filter by point classes.
>
> > **Parameters**
> > **point_classes** (`Metashape.PointClass` | `list[Metashape.PointClass]`) – List of point classes.

setConfidenceFilter(*min_confidence*, *max_confidence*)

> Set filter by confidence.
>
> > **Parameters**
> >
> > - **min_confidence** (`int`) – Minimum confidence value.
> > - **max_confidence** (`int`) – Maximum confidence value.

setSelectionFilter()

> Set filter by selection.

transform

> 4x4 point cloud transformation matrix.
>
> > **Type**
> > *Metashape.Matrix*

---

updateStatistics([*progress*])

  Updates point cloud statistics.

   Parameters

    progress (`Callable[[float], None]`) – Progress callback.

class Metashape.**PointCloudFormat**

  Point cloud format in [PointCloudFormatNone, PointCloudFormatOBJ, PointCloudFormatPLY, PointCloud-FormatXYZ, PointCloudFormatLAS, PointCloudFormatExpe, PointCloudFormatU3D, PointCloudFormatPDF, PointCloudFormatE57, PointCloudFormatOC3, PointCloudFormatPotree, PointCloudFormatLAZ, PointCloud-FormatCL3, PointCloudFormatPTS, PointCloudFormatPTX, PointCloudFormatDXF, PointCloudFormatCe-sium, PointCloudFormatPCD, PointCloudFormatSLPK, PointCloudFormatCOPC]

class Metashape.**PointCloudGroup**

  PointCloudGroup objects define groups of multiple laser scans. The grouping is established by assignment of a PointCloudGroup instance to the PointCloud.group attribute of participating laser scans.

  crs

   Reference coordinate system.

    Type

     [Metashape.CoordinateSystem](#) | None

  fixed

   Fix relative laser scan positions within the group.

    Type

     bool

  key

   Asset group identifier.

    Type

     int

  label

   Point cloud group label.

    Type

     str

  meta

   Asset group meta data.

    Type

     [Metashape.MetaData](#)

  selected

   Current selection state.

    Type

     bool

  transform

   4x4 asset group transformation matrix.

    Type

     [Metashape.Matrix](#)

class Metashape.**Preselection**
>   Image pair preselection in [NoPreselection, GenericPreselection, ReferencePreselection]

class Metashape.**RPCModel**
>   Rational polynomial model.

>   **copy**()
>   >   Return a copy of the object.
>   >
>   >   >   **Returns**
>   >   >   >   A copy of the object.
>   >   >
>   >   >   **Return type**
>   >   >   >   *Metashape.RPCModel*

>   **error**(*point*, *proj*)
>   >   Returns projection error.
>   >
>   >   >   **Parameters**
>   >   >   >   - **point** (Metashape.Vector) – Coordinates of the point to be projected.
>   >   >   >   - **proj** (Metashape.Vector) – Pixel coordinates of the point.
>   >   >
>   >   >   **Returns**
>   >   >   >   2D projection error.
>   >   >
>   >   >   **Return type**
>   >   >   >   *Metashape.Vector*

>   **image_offset**
>   >   Image coordinate offset.
>   >
>   >   >   **Type**
>   >   >   >   *Metashape.Vector*

>   **image_scale**
>   >   Image coordinate scale.
>   >
>   >   >   **Type**
>   >   >   >   *Metashape.Vector*

>   **line_den_coeff**
>   >   Line denominator.
>   >
>   >   >   **Type**
>   >   >   >   *Metashape.Vector*

>   **line_num_coeff**
>   >   Line numerator.
>   >
>   >   >   **Type**
>   >   >   >   *Metashape.Vector*

>   **load**(*path*[, *format*])
>   >   Load RPC model from file.
>   >
>   >   >   **Parameters**
>   >   >   >   - **path** (str) – Path to RPC model file.
>   >   >   >   - **format** (str) – RPC model file format in ['rpc', 'rpb', 'dimap']. Tiled DIMAP files are not supported.

object_offset

Object coordinate offset.

> **Type**
> *[Metashape.Vector](#)*

object_scale

Object coordinate scale.

> **Type**
> *[Metashape.Vector](#)*

project(*point*)

Returns projected pixel coordinates of the point.

> **Parameters**
> **point** (`Metashape.Vector`) – Coordinates of the point to be projected.

> **Returns**
> 2D projected point coordinates.

> **Return type**
> *[Metashape.Vector](#)*

samp_den_coeff

Sample denominator.

> **Type**
> *[Metashape.Vector](#)*

samp_num_coeff

Sample numerator.

> **Type**
> *[Metashape.Vector](#)*

save(*path*[, *format*])

Save RPC model to file.

> **Parameters**
>
> - **path** (`str`) – Path to RPC model file.
>
> - **format** (`str`) – RPC model file format in ['rpc', 'rpb'].

unproject(*point*)

Returns direction corresponding to the image point.

> **Parameters**
> **point** (`Metashape.Vector`) – Pixel coordinates of the point.

> **Returns**
> 3D vector in the camera coordinate system.

> **Return type**
> *[Metashape.Vector](#)*

class `Metashape.RasterFormat`

Raster format in [RasterFormatNone, RasterFormatTiles, RasterFormatKMZ, RasterFormatXYZ, RasterFormatMBTiles, RasterFormatWW, RasterFormatTMS, RasterFormatGeoPackage]

class Metashape.**RasterTransform**

 Raster transform definition.

  calibrateRange()

   Auto detect range based on orthomosaic histogram.

  copy()

   Return a copy of the object.

    Returns

     A copy of the object.

    Return type

     Metashape.RasterTransform

  enabled

   Enable flag.

    Type

     bool

  false_color

   False color channels.

    Type

     list

  formula

   Raster calculator expression.

    Type

     str

  interpolation

   Interpolation enable flag.

    Type

     bool

  palette

   Color palette.

    Type

     dict

  range

   Palette mapping range.

    Type

     tuple

  reset()

   Reset raster transform.

class Metashape.**RasterTransformType**

 Raster transformation type in [RasterTransformNone, RasterTransformValue, RasterTransformPalette]

class Metashape.**ReferenceFormat**

 Reference format in [ReferenceFormatNone, ReferenceFormatXML, ReferenceFormatTEL, ReferenceFormatCSV, ReferenceFormatMavinci, ReferenceFormatBramor, ReferenceFormatAPM]

class Metashape.**ReferenceItems**

    Reference items in [ReferenceItemsCameras, ReferenceItemsMarkers, ReferenceItemsScalebars]

class Metashape.**ReferencePreselectionMode**

    Reference preselection mode in [ReferencePreselectionSource, ReferencePreselectionEstimated, ReferencePreselectionSequential]

class Metashape.**Region**

    Region parameters

    center

        Region center coordinates.

            Type

                Metashape.Vector

    copy()

        Return a copy of the object.

            Returns

                A copy of the object.

            Return type

                Metashape.Region

    rot

        Region rotation matrix.

            Type

                Metashape.Matrix

    size

        Region size.

            Type

                Metashape.Vector

class Metashape.**RotationOrder**

    Rotation order in [RotationOrderXYZ, RotationOrderXZY, RotationOrderYXZ, RotationOrderYZX, RotationOrderZXY, RotationOrderZYX]

class Metashape.**Scalebar**

    Scale bar instance

    class Reference

        Scale bar reference data

        accuracy

            Scale bar length accuracy.

                Type

                    float

        distance

            Scale bar length.

                Type

                    float

enabled

Enabled flag.

> **Type**
>> bool

chunk

Chunk the scalebar belongs to.

> **Type**
>> *Metashape.Chunk*

frames

Scale bar frames.

> **Type**
>> list[*Metashape.Scalebar*]

group

Scale bar group.

> **Type**
>> *Metashape.ScalebarGroup*

key

Scale bar identifier.

> **Type**

label

Scale bar label.

> **Type**
>> str

meta

Scale bar meta data.

> **Type**
>> *Metashape.MetaData*

point0

Start of the scale bar.

> **Type**
>> *Metashape.Marker* | *Metashape.Camera*

point1

End of the scale bar.

> **Type**
>> *Metashape.Marker* | *Metashape.Camera*

reference

Scale bar reference data.

> **Type**
>> *Metashape.Scalebar.Reference*

selected

Selects/deselects the scale bar.

> **Type**
>> bool

class Metashape.**ScalebarGroup**

ScalebarGroup objects define groups of multiple scale bars. The grouping is established by assignment of a ScalebarGroup instance to the Scalebar.group attribute of participating scale bars.

key

Scale bar group identifier.

> **Type**
>> int

label

Scale bar group label.

> **Type**
>> str

selected

Current selection state.

> **Type**
>> bool

class Metashape.**Sensor**

Sensor instance

class Reference

Sensor reference data.

accuracy

Sensor location accuracy.
> **Type**
>> *Metashape.Vector*

enabled

Location enabled flag.
> **Type**
>> bool

location

Sensor coordinates.
> **Type**
>> *Metashape.Vector*

location_accuracy

Sensor location accuracy.

strip_extensions

Strip file extensions from camera labels.
> **Type**
> bool

target

Task target.
> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask($\big[$*objects*$\big]$)

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

workitem_count

Work item count.
> **Type**
> int

class AlignCameras

Task class containing processing parameters.

adaptive_fitting

Enable adaptive fitting of distortion coefficients.
> **Type**
> bool

apply(*object*$\big[$, *workitem*$\big]$$\big[$, *progress*$\big]$)

Apply task to specified object.
> **Parameters**
> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> - **workitem** (`int`) – Workitem index.
> - **progress** (`Callable[[float], None]`) – Progress callback.

cameras

List of cameras to align.
> **Type**
> list[int]

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

> **Type**
>> bool

min_image

Minimum number of point projections.

> **Type**
>> int

name

Task name.

> **Type**
>> str

point_clouds

List of point clouds to align.

> **Type**
>> list[int]

reset_alignment

Reset current alignment.

> **Type**
>> bool

subdivide_task

Enable fine-level task subdivision.

> **Type**
>> bool

target

Task target.

> **Type**
>> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.

> **Parameters**
>> **objects** (Metashape.Document | Metashape.Chunk | *list[*Metashape.Chunk*]*) – Objects to be processed.

workitem_count

Work item count.

> **Type**
>> int

class AlignChunks

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.

> **Parameters**
> - **object** ([Metashape.Chunk](#) | [Metashape.Document](#)) – Chunk or Document object to be processed.
> - **workitem** (*int*) – Workitem index.
> - **progress** (*Callable[[float], None]*) – Progress callback.

chunks

List of chunks to be aligned.

> **Type**
> list[int]

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

downscale

Alignment accuracy (0 - Highest, 1 - High, 2 - Medium, 4 - Low, 8 - Lowest).

> **Type**
> int

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

filter_mask

Filter points by mask.

> **Type**
> bool

fit_scale

Fit chunk scale during alignment.

> **Type**
> bool

generic_preselection

Enables image pair preselection.

> **Type**
> bool

gpu_support

GPU support flag.

> **Type**
> bool

keypoint_limit

Maximum number of points for each photo.

> **Type**
> int

markers

> List of markers to be used for marker based alignment.
>> **Type**
>>> list[int]

mask_tiepoints

> Apply mask filter to tie points.
>> **Type**
>>> bool

method

> Alignment method (0 - point based, 1 - marker based, 2 - camera based).
>> **Type**

workitem_count

> Work item count.
>> **Type**
>>> int

class AnalyzeImages

Task class containing processing parameters.

apply(*object*$\big[$, *workitem*$\big]\big[$, *progress*$\big]$)

> Apply task to specified object.
>> **Parameters**
>>> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
>>> - **workitem** (`int`) – Workitem index.
>>> - **progress** (`Callable[[float], None]`) – Progress callback.

cameras

> List of cameras to be analyzed.
>> **Type**
>>> list[int]

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

filter_mask

Constrain analyzed image region by mask.
> **Type**
> bool

gpu_support

GPU support flag.
> **Type**
> bool

name

Task name.
> **Type**
> str

target

Task target.
> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

workitem_count

Work item count.
> **Type**
> int

class BuildContours

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.
> **Parameters**
> • **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> • **workitem** (`int`) – Workitem index.
> • **progress** (`Callable[[float], None]`) – Progress callback.

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

    Initialize task parameters from a JSON string.

encode()

    Create a dictionary with task parameters.

encodeJSON()

    Create a JSON string with task parameters.

gpu_support

    GPU support flag.

        Type

            bool

interval

    Contour interval.

        Type

            float

max_value

    Maximum value of contour range.

        Type

            float

min_value

    Minimum value of contour range.

        Type

            float

name

    Task name.

        Type

            str

prevent_intersections

    Prevent contour intersections.

        Type

            bool

source_data

    Source data for contour generation.

        Type

            Metashape.DataSource

target

    Task target.

        Type

            Metashape.Tasks.TargetType

toNetworkTask([*objects*])

    Convert task to `Metashape.NetworkTask` to be applied to specified objects.

        Parameters

        objects (Metashape.Document | Metashape.Chunk | *list[*Metashape.Chunk*]*) – Objects to be processed.

> **workitem_count**
>> Work item count.

>> - **object** (Metashape.Chunk | Metashape.Document) – Chunk or Document object to be processed.
>> - **workitem** (*int*) – Workitem index.
>> - **progress** (*Callable[[float], None]*) – Progress callback.

asset

Asset to process.
> **Type**
>> int

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

frames

List of frames to process.
> **Type**
>> list[int]

gpu_support

GPU support flag.
> **Type**
>> bool

keep_depth

Enable store depth maps option.
> **Type**
>> bool

max_neighbors

Maximum number of neighbor images to use for depth map filtering.
> **Type**
>> int

max_workgroup_size

Maximum workgroup size.
> **Type**
>> int

name

Task name.
> **Type**
> str

point_colors

Enable point colors calculation.
> **Type**
> bool

point_confidence

Enable point confidence calculation.
> **Type**
> bool

points_spacing

Desired point spacing (m).
> **Type**
> float

replace_asset

Replace default asset with generated point cloud.
> **Type**
> bool

source_data

Source data to extract points from.
> **Type**
> *Metashape.DataSource*

subdivide_task

Enable fine-level task subdivision.
> **Type**
> bool

target

Task target.
> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask(*[objects]*)

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

uniform_sampling

Enable uniform point sampling.
> **Type**
> bool

workitem_count

Work item count.
> **Type**
> int

workitem_size_cameras

>   Number of cameras in a workitem.
>   > **Type**
>   >   int

class BuildSeamlines

>   Task class containing processing parameters.

>   **apply**(*object*[, *workitem*][, *progress*])

>   >   Apply task to specified object.
>   >   > **Parameters**
>   >   >   - **object** ([Metashape.Chunk](#) | [Metashape.Document](#)) – Chunk or Document object to be processed.
>   >   >   - **workitem** (*int*) – Workitem index.
>   >   >   - **progress** (*Callable[[float], None]*) – Progress callback.

>   **decode**(*dict*)

>   >   Initialize task parameters with a dictionary.

>   **decodeJSON**(*json*)

>   >   Initialize task parameters from a JSON string.

>   **encode**()

>   >   Create a dictionary with task parameters.

>   **encodeJSON**()

>   >   Create a JSON string with task parameters.

>   **epsilon**

>   >   Contour simplificaion threshold.
>   >   > **Type**

class BuildTiledModel

> Task class containing processing parameters.

apply(*object* $\big[$, *workitem* $\big]$ $\big[$, *progress* $\big]$)

> Apply task to specified object.
> > **Parameters**

- **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
- **workitem** (`int`) – Workitem index.
- **progress** (`Callable[[float], None]`) – Progress callback.

classes

List of point classes to be used for surface extraction.
> **Type**
> list[int]

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

face_count

Number of faces per megapixel of texture resolution.
> **Type**
> int

frames

List of frames to process.
> **Type**
> list[int]

ghosting_filter

Enable ghosting filter.
> **Type**
> bool

gpu_support

GPU support flag.
> **Type**
> bool

keep_depth

Enable store depth maps option.
> **Type**
> bool

max_workgroup_size

Maximum workgroup size.
> **Type**
> int

merge

Merge tiled model flag.
> **Type**
> bool

name

> Task name.
> > **Type**
> > str

operand_asset

> Operand asset key.
> > **Type**
> > int

operand_chunk

> Operand chunk key.
> > **Type**
> > int

operand_frame

> Operand frame key.
> > **Type**
> > int

pixel_size

> Target model resolution in meters.
> > **Type**
> > float

replace_asset

> Replace default asset with generated tiled model.
> > **Type**
> > bool

source_data

> Selects between point cloud and mesh.
> > **Type**
> > *[Metashape.DataSource](#)*

subdivide_task

> Enable fine-level task subdivision.
> > **Type**
> > bool

target

> Task target.
> > **Type**
> > *[Metashape.Tasks.TargetType](#)*

tile_size

> Size of tiles in pixels.
> > **Type**
> > int

toNetworkTask([*objects*])

> Convert task to [`Metashape.NetworkTask`](#) to be applied to specified objects.
> > **Parameters**
> > **objects** ([Metashape.Document](#) / [Metashape.Chunk](#) / *list[*[Metashape.Chunk](#)*]*) – Objects to be processed.

transfer_texture

   Transfer source model texture to tiled model.
      Type
         bool

workitem_count

   Work item count.
      Type
         int

workitem_size_cameras

   Number of cameras in a workitem.
      Type
         int

class BuildUV

   Task class containing processing parameters.

   apply(*object* [, *workitem*] [, *progress*])

      Apply task to specified object.
         Parameters
            • **object** ([`Metashape.Chunk`](#) | [`Metashape.Document`](#)) – Chunk or Document object
               to be processed.
            • **workitem** (*int*) – Workitem index.
            • **progress** (*Callable[[float], None]*) – Progress callback.

   camera

      Camera to be used for texturing in CameraMapping mode.
         Type
            int

   decode(*dict*)

      Initialize task parameters with a dictionary.

   decodeJSON(*json*)

      Initialize task parameters from a JSON string.

   encode()

      Create a dictionary with task parameters.

   encodeJSON()

      Create a JSON string with task parameters.

   gpu_support

      GPU support flag.
         Type
            bool

   mapping_mode

      Texture mapping mode.
         Type
            [Metashape.MappingMode](#)

   name

      Task name.
         Type
            str

page_count

Number of texture pages to generate.
> **Type**
>> int

pixel_size

Texture resolution in meters.
> **Type**
>> float

target

Task target.
> **Type**
>> *Metashape.Tasks.TargetType*

texture_size

Expected size of texture page at texture generation step.
> **Type**
>> int

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
>> **objects** ([Metashape.Document] | Metashape.Chunk | list[Metashape. Chunk]) – Objects to be processed.

workitem_count

Work item count.
> **Type**
>> int

class CalculatePointNormals

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.
> **Parameters**
>> - **object** ([Metashape.Chunk] | [Metashape.Document]) – Chunk or Document object to be processed.
>> - **workitem** (int) – Workitem index.
>> - **progress** (Callable[[float], None]) – Progress callback.

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

> **Type**
>> bool

name

> Task name.
>> **Type**
>>> str

point_cloud

> Point cloud key to process.
>> **Type**
>>> int

point_neighbors

> Number of point neighbors to use for normal estimation.
>> **Type**
>>> int

target

> Task target.
>> **Type**
>>> *[Metashape.Tasks.TargetType](#)*

toNetworkTask($\big[$*objects*$\big]$)

> Convert task to `Metashape.NetworkTask` to be applied to specified objects.
>> **Parameters**
>>> **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

workitem_count

> Work item count.
>> **Type**
>>> int

class CalibrateCamera

> Task class containing processing parameters.

> **apply**(*object*$\big[$, *workitem*$\big]$$\big[$, *progress*$\big]$)

>> Apply task to specified object.
>>> **Parameters**
>>> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
>>> - **workitem** (`int`) – Workitem index.
>>> - **progress** (`Callable[[float], None]`) – Progress callback.

> **border**

>> Border size to ignore.
>>> **Type**
>>>> int

> **decode**(*dict*)

>> Initialize task parameters with a dictionary.

> **decodeJSON**(*json*)

>> Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

fit_b1

Enable optimization of aspect ratio.

> **Type**
> bool

fit_b2

Enable optimization of skew coefficient.

> **Type**
> bool

fit_cxcy

Enable optimization of principal point coordinates.

> **Type**
> bool

fit_f

Enable optimization of focal length coefficient.

> **Type**
> bool

fit_k1

Enable optimization of k1 radial distortion coefficient.

> **Type**
> bool

fit_k2

Enable optimization of k2 radial distortion coefficient.

> **Type**
> bool

fit_k3

Enable optimization of k3 radial distortion coefficient.

> **Type**
> bool

fit_k4

Enable optimization of k4 radial distortion coefficient.

> **Type**
> bool

fit_p1

Enable optimization of p1 tangential distortion coefficient.

> **Type**
> bool

fit_p2

Enable optimization of p2 tangential distortion coefficient.

> **Type**
> bool

gpu_support

GPU support flag.
> **Type**
> bool

name

Task name.
> **Type**
> str

target

Task target.
> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

workitem_count

Work item count.
> **Type**
> int

class CalibrateColors

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.
> **Parameters**
> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> - **workitem** (*int*) – Workitem index.
> - **progress** (`Callable[[float], None]`) – Progress callback.

cameras

List of cameras to process.
> **Type**
> list[int]

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

> **Type**
> > bool

name

> Task name.
> > **Type**
> > > str

source_data

> Source data for calibration.
> > **Type**

> **decodeJSON**(*json*)

> > Initialize task parameters from a JSON string.

> **encode**()

> > Create a dictionary with task parameters.

> **encodeJSON**()

> > Create a JSON string with task parameters.

gpu_support

    GPU support flag.

        Type

            bool

name

    Task name.

        Type

            str

target

    Task target.

        Type

            Metashape.Tasks.TargetType

toNetworkTask($\big[$*objects*$\big]$)

    Convert task to `Metashape.NetworkTask` to be applied to specified objects.

        Parameters

        objects (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

use_reflectance_panels

    Use calibrated reflectance panels.

        Type

            bool

use_sun_sensor

    Apply irradiance sensor measurements.

        Type

            bool

workitem_count

    Work item count.

        Type

            int

class ClassifyGroundPoints

    Task class containing processing parameters.

    apply(*object*$\big[$, *workitem*$\big]\big[$, *progress*$\big]$)

        Apply task to specified object.

            Parameters

            • **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.

            • **workitem** (`int`) – Workitem index.

            • **progress** (`Callable[[float], None]`) – Progress callback.

    cell_size

        Cell size (meters).

            Type

                float

    decode(*dict*)

        Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

erosion_radius

Erosion radius (meters).

> **Type**
> float

gpu_support

GPU support flag.

> **Type**
> bool

keep_existing

Keep existing ground points.

> **Type**
> bool

max_angle

Maximum angle (degrees).

> **Type**
> float

max_distance

Maximum distance (meters).

> **Type**
> float

max_terrain_slope

Maximum terrain slope angle (degrees).

> **Type**
> float

name

Task name.

> **Type**
> str

point_cloud

Point cloud key to classify.

> **Type**
> int

return_number

Point return number to use (0 - any return, 1 - first return, -1 - last return).

> **Type**
> int

source_class

Class of points to be re-classified.

> **Type**
>> int

target

> Task target.
>> **Type**
>>> *Metashape.Tasks.TargetType*

toNetworkTask($\big[$*objects*$\big]$)

> Convert task to `Metashape.NetworkTask` to be applied to specified objects.
>> **Parameters**
>>> **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[`Metashape.`Chunk`]`) – Objects to be processed.

workitem_count

> Work item count.
>> **Type**
>>> int

class ClassifyPoints

> Task class containing processing parameters.

apply(*object*$\big[$, *workitem*$\big]$$\big[$, *progress*$\big]$)

> Apply task to specified object.
>> **Parameters**
>>> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
>>> - **workitem** (`int`) – Workitem index.
>>> - **progress** (`Callable[[float], None]`) – Progress callback.

confidence

> Required confidence level.
>> **Type**
>>> float

decode(*dict*)

> Initialize task parameters with a dictionary.

decodeJSON(*json*)

> Initialize task parameters from a JSON string.

encode()

> Create a dictionary with task parameters.

encodeJSON()

> Create a JSON string with task parameters.

gpu_support

> GPU support flag.
>> **Type**

decode(*dict*)

> Initialize task parameters with a dictionary.

decodeJSON(*json*)

> Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.
> **Type**
> > bool

model

Key of model to colorize.
> **Type**
> > int

name

Task name.

source_data

Source data to extract colors from.
> **Type**
> > *Metashape.DataSource*

target

Task target.
> **Type**
> > *Metashape.Tasks.TargetType*

toNetworkTask($\big[$*objects*$\big]$)

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> > **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

workitem_count

Work item count.
> **Type**
> > int

class ColorizePointCloud

Task class containing processing parameters.

apply(*object*$\big[$*, workitem*$\big]$$\big[$*, progress*$\big]$)

Apply task to specified object.
> **Parameters**
> > - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> > - **workitem** (*int*) – Workitem index.
> > - **progress** (*Callable[[float], None]*) – Progress callback.

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

> **Type**
> bool

max_workgroup_size

Maximum workgroup size.

> **Type**

class ConvertImages

    Task class containing processing parameters.

    apply(*object* [, *workitem*] [, *progress*])

        Apply task to specified object.

            Parameters

                • **object** ([Metashape.Chunk](#) | [Metashape.Document](#)) – Chunk or Document object to be processed.
                • **workitem** (*int*) – Workitem index.
                • **progress** (*Callable[[float], None]*) – Progress callback.

    cameras

        List of cameras to process.

            Type

                list[int]

    color_correction

        Apply color correction.

            Type

                bool

    decode(*dict*)

        Initialize task parameters with a dictionary.

    decodeJSON(*json*)

        Initialize task parameters from a JSON string.

    encode()

        Create a dictionary with task parameters.

    encodeJSON()

        Create a JSON string with task parameters.

    gpu_support

        GPU support flag.

            Type

                bool

    image_compression

        Image compression parameters.

            Type

                [Metashape.ImageCompression](#)

    merge_planes

        Merge multispectral images.

            Type

                bool

    name

        Task name.

            Type

                str

    path

        Path to output file.

            Type

                str

target

> Task target.
>> **Type**
>> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

> Convert task to `Metashape.NetworkTask` to be applied to specified objects.
>> **Parameters**
>> **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

update_gps_tags

> Update GPS tags.
>> **Type**
>> bool

use_initial_calibration

> Transform to initial calibration.
>> **Type**
>> bool

workitem_count

> Work item count.
>> **Type**
>> int

class DecimateModel

> Task class containing processing parameters.

> **apply**(*object*[, *workitem*][, *progress*])

>> Apply task to specified object.
>>> **Parameters**
>>> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
>>> - **workitem** (`int`) – Workitem index.
>>> - **progress** (`Callable[[float], None]`) – Progress callback.

> **apply_to_selection**

decodeJSON(*json*)

    Initialize task parameters from a JSON string.

encode()

    Create a dictionary with task parameters.

encodeJSON()

    Create a JSON string with task parameters.

gpu_support

    GPU support flag.

        Type

            bool

name

    Task name.

        Type

            str

target

    Task target.

        Type

            Metashape.Tasks.TargetType

toNetworkTask([*objects*])

    Convert task to `Metashape.NetworkTask` to be applied to specified objects.

        Parameters

            objects (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

workitem_count

    Work item count.

        Type

            int

class DuplicateChunk

    Task class containing processing parameters.

    apply(*object*[, *workitem*][, *progress*])

        Apply task to specified object.

            Parameters

                • **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.

                • **workitem** (*int*) – Workitem index.

                • **progress** (*Callable[[float], None]*) – Progress callback.

    chunk

        Chunk to copy.

            Type

                int

    copy_depth_maps

        Copy depth maps.

            Type

                bool

copy_elevations

    Copy DEMs.
        Type
            bool

copy_keypoints

    Copy keypoints.
        Type
            bool

copy_models

    Copy models.
        Type
            bool

copy_orthomosaics

    Copy orthomosaics.
        Type
            bool

copy_point_clouds

    Copy point clouds.
        Type
            bool

copy_tiled_models

    Copy tiled models.
        Type
            bool

decode(*dict*)

    Initialize task parameters with a dictionary.

decodeJSON(*json*)

    Initialize task parameters from a JSON string.

encode()

    Create a dictionary with task parameters.

encodeJSON()

    Create a JSON string with task parameters.

frames

    List of frame keys to copy.
        Type
            list[int]

gpu_support

    GPU support flag.
        Type
            bool

label

    New chunk label.
        Type
            str

name

Task name.
> **Type**
> > str

target

Task target.
> **Type**
> > *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> > **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

workitem_count

Work item count.
> **Type**
> > int

class ExportCameras

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.
> **Parameters**
> > - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> > - **workitem** (`int`) – Workitem index.
> > - **progress** (`Callable[[float], None]`) – Progress callback.

binary

Enables/disables binary encoding for selected format (if applicable).
> **Type**
> > bool

bingo_path_geoin

Path to BINGO GEO INPUT file.
> **Type**
> > str

bingo_path_gps

Path to BINGO GPS/IMU file.
> **Type**
> > str

bingo_path_image

Path to BINGO IMAGE COORDINATE file.
> **Type**
> > str

bingo_path_itera

Path to BINGO ITERA file.
> **Type**
> > str

bingo_save_geoin

Enables/disables export of BINGO GEO INPUT file.
> **Type**
> bool

bingo_save_gps

Enables/disables export of BINGO GPS/IMU data.
> **Type**
> bool

bingo_save_image

Enables/disables export of BINGO IMAGE COORDINATE file.
> **Type**
> bool

bingo_save_itera

Enables/disables export of BINGO ITERA file.
> **Type**
> bool

bundler_path_list

Path to Bundler image list file.
> **Type**
> str

bundler_save_list

Enables/disables export of Bundler image list file.
> **Type**
> bool

chan_rotation_order

Rotation order (CHAN format only).
> **Type**
> *Metashape.RotationOrder*

crs

Output coordinate system.
> **Type**
> *Metashape.CoordinateSystem*

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

format

Export format.
> **Type**
> *Metashape.CamerasFormat*

gpu_support

> GPU support flag.
> > **Type**
> > > bool

image_orientation

> Image coordinate system (0 - X right, 1 - X up, 2 - X left, 3 - X down).
> > **Type**
> > > int

name

> Task name.
> > **Type**
> > > str

path

> Path to output file.
> > **Type**

embed_texture

Embeds texture inside the model file (if supported by format).

> **Type**
>> bool

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

format

Export format.

> **Type**
>> *Metashape.ModelFormat*

gltf_y_up

Enables/disables y-up axes notation used in glTF.

> **Type**
>> bool

gpu_support

GPU support flag.

> **Type**
>> bool

model

Model key to export.

> **Type**
>> int

name

Task name.

> **Type**
>> str

path

Path to output model.

> **Type**
>> str

precision

Number of digits after the decimal point (for text formats).

> **Type**
>> int

raster_transform

Raster band transformation.

> **Type**
>> *Metashape.RasterTransformType*

save_alpha

Enables/disables alpha channel export.

> **Type**
>> bool

save_cameras

> Enables/disables camera export.

> > **Type**
> >
> > > bool

shift

> Optional shift to be applied to vertex coordinates.
>
> > **Type**
> >
> > > *Metashape.Vector*

strip_extensions

    Strips camera label extensions during export.

        Type

            bool

target

    Task target.

        Type

            Metashape.Tasks.TargetType

texture_format

    Texture format.

        Type

            Metashape.ImageFormat

toNetworkTask([*objects*])

    Convert task to `Metashape.NetworkTask` to be applied to specified objects.

        Parameters

            objects (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

viewpoint

    Default view.

        Type

            Metashape.Viewpoint

workitem_count

    Work item count.

        Type

            int

class ExportOrthophotos

    Task class containing processing parameters.

    apply(*object*[, *workitem*][, *progress*])

        Apply task to specified object.

            Parameters

                • **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.

                • **workitem** (`int`) – Workitem index.

                • **progress** (`Callable[[float], None]`) – Progress callback.

    cameras

        List of cameras to process.

            Type

                list[int]

    decode(*dict*)

        Initialize task parameters with a dictionary.

    decodeJSON(*json*)

        Initialize task parameters from a JSON string.

    encode()

        Create a dictionary with task parameters.

encodeJSON()
>   Create a JSON string with task parameters.

gpu_support
>   GPU support flag.
>   >   **Type**

>   >   >   float

resolution_y
>   Pixel size in the Y dimension in projected units.
>   >   **Type**
>   >   >   float

save_alpha

Enable alpha channel generation.
> **Type**
> bool

save_kml

Enable kml file generation.
> **Type**
> bool

save_world

Enable world file generation.
> **Type**
> bool

target

Task target.
> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask($[objects]$)

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> **objects** (Metashape.Document | Metashape.Chunk | `list[Metashape.Chunk]`) – Objects to be processed.

white_background

Enable white background.
> **Type**
> bool

workitem_count

Work item count.
> **Type**
> int

class ExportPointCloud

Task class containing processing parameters.

apply($object[, workitem][, progress]$)

Apply task to specified object.
> **Parameters**
> • **object** (Metashape.Chunk | Metashape.Document) – Chunk or Document object to be processed.
> • **workitem** (`int`) – Workitem index.
> • **progress** (`Callable[[float], None]`) – Progress callback.

binary

Enables/disables binary encoding for selected format (if applicable).
> **Type**
> bool

block_height

Block height in meters.
> **Type**
> float

block_width

    Block width in meters.

        Type

            float

classes

    List of point classes to be exported.

        Type

            list[int]

clip_to_boundary

    Clip point cloud to boundary shapes.

        Type

            bool

colors_rgb_8bit

    Convert colors to 8 bit RGB.

        Type

            bool

comment

    Optional comment (if supported by selected format).

        Type

            str

compression

    Enable compression (Cesium format only).

        Type

            bool

crs

    Output coordinate system.

        Type

            Metashape.CoordinateSystem

decode(*dict*)

    Initialize task parameters with a dictionary.

decodeJSON(*json*)

    Initialize task parameters from a JSON string.

encode()

    Create a dictionary with task parameters.

encodeJSON()

    Create a JSON string with task parameters.

folder_depth

    Tileset subdivision depth (Cesium format only).

        Type

            int

format

    Export format.

        Type

            Metashape.PointCloudFormat

gpu_support

            int

clip_to_boundary

    Clip raster to boundary shapes.
        Type
            bool

decode(*dict*)

    Initialize task parameters with a dictionary.

decodeJSON(*json*)

    Initialize task parameters from a JSON string.

description

    Export description.
        Type
            str

encode()

    Create a dictionary with task parameters.

encodeJSON()

    Create a JSON string with task parameters.

format

    Export format.
        Type
            [Metashape.RasterFormat](#)

global_profile

    Use global profile (GeoPackage format only).
        Type
            bool

gpu_support

    GPU support flag.
        Type
            bool

height

    Raster height.
        Type
            int

image_compression

    Image compression parameters.
        Type
            [Metashape.ImageCompression](#)

image_description

    Optional description to be added to image files.
        Type
            str

image_format

Tile format.

> **Type**
>> *Metashape.ImageFormat*

max_zoom_level

Maximum zoom level (GeoPackage, Google Map Tiles, MBTiles and World Wind Tiles formats only).

> **Type**
>> int

min_zoom_level

Minimum zoom level (GeoPackage, Google Map Tiles, MBTiles and World Wind Tiles formats only).

> **Type**
>> int

name

Task name.

>   **columns**

>>   Column order in csv format (n - label, o - enabled flag, x/y/z - coordinates, X/Y/Z - coordinate accuracy, a/b/c - rotation angles, A/B/C - rotation angle accuracy, u/v/w - estimated coordinates, U/V/W - coordinate errors, d/e/f - estimated orientation angles, D/E/F - orientation errors, p/q/r - estimated coordinates variance, i/j/k - estimated orientation angles variance, [] - group of multiple values, | - column separator within group).
>>> **Type**
>>>> str

decode(*dict*)

    Initialize task parameters with a dictionary.

decodeJSON(*json*)

    Initialize task parameters from a JSON string.

delimiter

    Column delimiter in csv format.

        Type

            str

encode()

    Create a dictionary with task parameters.

encodeJSON()

    Create a JSON string with task parameters.

format

    Export format.

        Type

            [Metashape.ReferenceFormat](#)

gpu_support

    GPU support flag.

        Type

            bool

items

    Items to export in CSV format.

        Type

            [Metashape.ReferenceItems](#)

name

    Task name.

        Type

            str

path

    Path to the output file.

        Type

            str

precision

    Number of digits after the decimal point (for CSV format).

        Type

            int

target

    Task target.

        Type

            [Metashape.Tasks.TargetType](#)

toNetworkTask([*objects*])

    Convert task to [`Metashape.NetworkTask`](#) to be applied to specified objects.

        Parameters

        objects ([Metashape.Document](#) | [Metashape.Chunk](#) | *list[*[Metashape.Chunk](#)*]*) – Objects to be processed.

path

    Path to output report.

        Type

            str

target

    Task target.

        Type

            [Metashape.Tasks.TargetType](#)

title

    Report title.

        Type

            str

toNetworkTask($\big[$*objects*$\big]$)

    Convert task to `Metashape.NetworkTask` to be applied to specified objects.

        Parameters

            objects (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

user_settings

    A list of user defined settings to include on the Processing Parameters page.

        Type

            list[tuple[str, str]]

workitem_count

    Work item count.

        Type

            int

class ExportShapes

    Task class containing processing parameters.

    apply(*object*$\big[$, *workitem*$\big]$$\big[$, *progress*$\big]$)

        Apply task to specified object.

            Parameters

                • **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.

                • **workitem** (`int`) – Workitem index.

                • **progress** (`Callable[[float], None]`) – Progress callback.

    crs

        Output coordinate system.

            Type

               [Metashape.CoordinateSystem](#)

    decode(*dict*)

        Initialize task parameters with a dictionary.

    decodeJSON(*json*)

        Initialize task parameters from a JSON string.

    encode()

        Create a dictionary with task parameters.

encodeJSON()
> Create a JSON string with task parameters.

target

Task target.

> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.

> **Parameters**
> **objects** (Metashape.Document | Metashape.Chunk | *list[*Metashape.Chunk*]*) – Objects to be processed.

workitem_count

Work item count.

> **Type**
> int

class ExportTexture

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.

> **Parameters**
> - **object** (Metashape.Chunk | Metashape.Document) – Chunk or Document object to be processed.
> - **workitem** (*int*) – Workitem index.
> - **progress** (*Callable[[float], None]*) – Progress callback.

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

class GeneratePrescriptionMap

> Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

    Apply task to specified object.

        Parameters

- **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
- **workitem** (`int`) – Workitem index.
- **progress** (`Callable[[float], None]`) – Progress callback.

boundary_shape_group

    Boundary shape group.

        Type

           int

breakpoints

    Classification breakpoints.

        Type

           list[float]

cell_size

    Step of prescription grid, meters.

        Type

           float

class_count

    Number of classes.

        Type

           int

classification_method

    Index values classification method.

        Type

           Metashape.ClassificationMethod

decode(*dict*)

    Initialize task parameters with a dictionary.

decodeJSON(*json*)

    Initialize task parameters from a JSON string.

encode()

    Create a dictionary with task parameters.

encodeJSON()

    Create a JSON string with task parameters.

gpu_support

    GPU support flag.

        Type

           bool

name

    Task name.

        Type

           str

rates

    Fertilizer rate for each class.

Type
list[float]

target

Task target.
Type
Metashape.Tasks.TargetType

toNetworkTask(⌈*objects*⌉)

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
Parameters
objects (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

workitem_count

Work item count.
Type
int

class ImportCameras

Task class containing processing parameters.

apply(*object*⌈, *workitem*⌉⌈, *progress*⌉)

Apply task to specified object.
Parameters
- **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
- **workitem** (`int`) – Workitem index.
- **progress** (`Callable[[float], None]`) – Progress callback.

crs

Ground coordinate system.
Type
Metashape.CoordinateSystem

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

format

File format.
Type
Metashape.CamerasFormat

gpu_support

GPU support flag.
Type
bool

image_list

Path to image list file (Bundler format only).
> **Type**
>> str

image_orientation

Image coordinate system (0 - X right, 1 - X up, 2 - X left, 3 - X down).
> **Type**
>> int

load_image_list

Enable Bundler image list import.
> **Type**
>> bool

name

Task name.
> **Type**
>> str

path

Path to the file.
> **Type**
>> str

target

Task target.
> **Type**
>> *Metashape.Tasks.TargetType*

toNetworkTask($\big[$*objects*$\big]$)

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
>> **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

workitem_count

Work item count.
> **Type**
>> int

class ImportDepthImages

Task class containing processing parameters.

apply(*object*$\big[$, *workitem*$\big]\big[$, *progress*$\big]$)

Apply task to specified object.
> **Parameters**
>> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
>> - **workitem** (`int`) – Workitem index.
>> - **progress** (`Callable[[float], None]`) – Progress callback.

color_filenames

List of corresponding color files, if present.
> **Type**
>> list[str]

decode(*dict*)

> Initialize task parameters with a dictionary.

decodeJSON(*json*)

> Initialize task parameters from a JSON string.

encode()

> Create a dictionary with task parameters.

encodeJSON()

> Create a JSON string with task parameters.

filenames

> List of files to import.
> > **Type**
> > list[str]

format

> Point cloud format.

class ImportMarkers

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.

> **Parameters**
> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> - **workitem** (`int`) – Workitem index.
> - **progress** (`Callable[[float], None]`) – Progress callback.

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

> **Type**
> bool

name

Task name.

> **Type**
> str

path

Path to the file.

> **Type**
> str

target

Task target.

> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.

> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

workitem_count

Work item count.

> **Type**
> int

class ImportModel

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.

> **Parameters**
> - **object** ([Metashape.Chunk](#) | [Metashape.Document](#)) – Chunk or Document object to be processed.
> - **workitem** (*int*) – Workitem index.
> - **progress** (*Callable[[float], None]*) – Progress callback.

crs

Model coordinate system.

> **Type**
> *[Metashape.CoordinateSystem](#)*

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

decode_udim

Load UDIM texture layout.

> **Type**
> bool

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

format

Model format.

> **Type**
> *[Metashape.ModelFormat](#)*

frame_paths

List of model paths to import in each frame of a multiframe chunk.

> **Type**
> list[str]

gpu_support

GPU support flag.

> **Type**
> bool

name

Task name.

> **Type**
> str

path

Path to model.

> **Type**
> str

replace_asset

Replace default asset with imported model.

> **Type**
> bool

shift

Optional shift to be applied to vertex coordinates.
> **Type**
> *Metashape.Vector*

target

Task target.
> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

workitem_count

Work item count.
> **Type**
> int

class ImportPointCloud

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.
> **Parameters**
> * **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> * **workitem** (`int`) – Workitem index.
> * **progress** (`Callable[[float], None]`) – Progress callback.

calculate_normals

Calculate point normals.
> **Type**
> bool

crs

Point cloud coordinate system.
> **Type**
> *Metashape.CoordinateSystem*

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

format

> Point cloud format.
>
> > **Type**
> >
> > *[Metashape.PointCloudFormat](#)*

frame_paths

> List of point cloud paths to import in each frame of a multiframe chunk.
>
> > **Type**
> >
> > list[str]

gpu_support

> GPU support flag.
>
> > **Type**
> >

ignore_normals

> Ignore normals in imported file.
>
> > **Type**
> >
> > bool

ignore_scanner_origin

> Do not use laser scan origin as scanner position for structured point clouds.
>
> > **Type**
> >
> > bool

ignore_trajectory

> Do not attach trajectory to imported point cloud.
>
> > **Type**
> >
> > bool

import_images

> Import images embedded in laser scan.
>
> > **Type**
> >
> > bool

is_laser_scan

> Import point clouds as laser scans.
>
> > **Type**
> >
> > bool

name

> Task name.
>
> > **Type**
> >
> > str

path

> Path to point cloud.
>
> > **Type**
> >
> > str

point_neighbors

> Number of point neighbors to use for normal estimation.
>
> > **Type**
> >
> > int

precision

Coordinate precision (m). For default precision use 0.

> **Type**
> float

replace_asset

Replace default asset with imported point cloud.

> **Type**
> bool

scanner_at_origin

Use laser scan origin as scanner position for unstructured point clouds.

> **Type**
> bool

shift

Optional shift to be applied to point coordinates.

> **Type**
> *Metashape.Vector*

target

Task target.

> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask($\big[$*objects*$\big]$)

Convert task to `Metashape.NetworkTask` to be applied to specified objects.

> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

trajectory

Trajectory key to attach.

> **Type**
> int

workitem_count

Work item count.

> **Type**
> int

class ImportRaster

Task class containing processing parameters.

apply(*object*$\big[$*, workitem*$\big]\big[$*, progress*$\big]$)

Apply task to specified object.

> **Parameters**
> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> - **workitem** (`int`) – Workitem index.
> - **progress** (`Callable[[float], None]`) – Progress callback.

crs

Default coordinate system if not specified in GeoTIFF file.

> **Type**
> *Metashape.CoordinateSystem*

decode(*dict*)

> Initialize task parameters with a dictionary.

decodeJSON(*json*)

> Initialize task parameters from a JSON string.

encode()

> Create a dictionary with task parameters.

encodeJSON()

> Create a JSON string with task parameters.

frames

> List of frames to process.
> > **Type**
> > list[int]

gpu_support

> GPU support flag.
> > **Type**
> > bool

has_nodata_value

> No-data value valid flag.
> > **Type**

replace_asset

> Replace default raster with imported one.
> > **Type**
> > bool

target

> Task target.
> > **Type**
> > *[Metashape.Tasks.TargetType](#)*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.

> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

workitem_count

Work item count.

> **Type**
> int

class ImportReference

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.

> **Parameters**
> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> - **workitem** (`int`) – Workitem index.
> - **progress** (`Callable[[float], None]`) – Progress callback.

columns

Column order in csv format (n - label, o - enabled flag, x/y/z - coordinates, X/Y/Z - coordinate accuracy, a/b/c - rotation angles, A/B/C - rotation angle accuracy, [] - group of multiple values, | - column separator within group).

> **Type**
> str

create_markers

Create markers for missing entries (csv format only).

> **Type**
> bool

crs

Reference data coordinate system (csv format only).

> **Type**
> *Metashape.CoordinateSystem*

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

delimiter

Column delimiter in csv format.

> **Type**
> str

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

format

> File format.
> > **Type**

path

    Path to project file.

        Type

            str

read_only

    Open project in read only mode.

        Type

            bool

target

    Task target.

        Type

            Metashape.Tasks.TargetType

toNetworkTask([*objects*])

    Convert task to `Metashape.NetworkTask` to be applied to specified objects.

        Parameters

        objects (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

workitem_count

    Work item count.

        Type

            int

class MatchPhotos

    Task class containing processing parameters.

    apply(*object*[, *workitem*][, *progress*])

        Apply task to specified object.

            Parameters

                • **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
                • **workitem** (*int*) – Workitem index.
                • **progress** (*Callable[[float], None]*) – Progress callback.

    cameras

        List of cameras to match.

            Type

                list[int]

    decode(*dict*)

        Initialize task parameters with a dictionary.

    decodeJSON(*json*)

        Initialize task parameters from a JSON string.

    downscale

        Image alignment accuracy (0 - Highest, 1 - High, 2 - Medium, 4 - Low, 8 - Lowest).

            Type

                int

    downscale_3d

        Laser scan alignment accuracy (1 - Highest, 2 - High, 4 - Medium, 8 - Low, 16 - Lowest).

            Type

                int

encode()

> Create a dictionary with task parameters.

encodeJSON()

> Create a JSON string with task parameters.

filter_mask

> Filter points by mask.
>> **Type**
>>> bool

filter_stationary_points

> Exclude tie points which are stationary across images.
>> **Type**
>>> bool

generic_preselection

> Enable generic preselection.
>> **Type**
>>> bool

gpu_support

> GPU support flag.
>> **Type**
>>> bool

guided_matching

> Enable guided image matching.
>> **Type**
>>> bool

keep_keypoints

> Store keypoints in the project.
>> **Type**
>>> bool

keypoint_limit

> Key point limit.
>> **Type**
>>> int

keypoint_limit_3d

> Key point limit for laser scans.
>> **Type**
>>> int

keypoint_limit_per_mpx

> Key point limit per megapixel.
>> **Type**
>>> int

laser_scans_vertical_axis

> Common laser scans axis.
>> **Type**
>>> int

mask_tiepoints

Apply mask filter to tie points.
>   **Type**
>   >   bool

match_laser_scans

Match laser scans using geometric features.
>   **Type**
>   >   bool

max_workgroup_size

Maximum workgroup size.
>   **Type**
>   >   int

name

Task name.
>   **Type**
>   >   str

pairs

User defined list of camera pairs to match.
>   **Type**
>   >   list[tuple[int, int]]

reference_preselection

Enable reference preselection.
>   **Type**
>   >   bool

reference_preselection_mode

Reference preselection mode.
>   **Type**
>   >   *Metashape.ReferencePreselectionMode*

reset_matches

Reset current matches.
>   **Type**
>   >   bool

subdivide_task

Enable fine-level task subdivision.
>   **Type**
>   >   bool

target

Task target.
>   **Type**
>   >   *Metashape.Tasks.TargetType*

tiepoint_limit

Tie point limit.
>   **Type**
>   >   int

toNetworkTask($\big[$*objects*$\big]$)

> Convert task to `Metashape.NetworkTask` to be applied to specified objects.
>
> > **Parameters**
> > **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

workitem_count

> Work item count.
> > **Type**
> > int

workitem_size_cameras

> Number of cameras in a workitem.
> > **Type**
> > int

workitem_size_pairs

> Number of image pairs in a workitem.
> > **Type**
> > int

class MergeAssets

> Task class containing processing parameters.
>
> **apply**(*object*$\big[$, *workitem*$\big]\big[$, *progress*$\big]$)

fit_cx

    Enable optimization of X principal point coordinates.

        Type

           bool

fit_cy

    Enable optimization of Y principal point coordinates.

        Type

           bool

fit_f

    Enable optimization of focal length coefficient.

        Type

           bool

fit_k1

    Enable optimization of k1 radial distortion coefficient.

        Type

           bool

fit_k2

    Enable optimization of k2 radial distortion coefficient.

        Type

           bool

fit_k3

    Enable optimization of k3 radial distortion coefficient.

        Type

           bool

fit_k4

    Enable optimization of k3 radial distortion coefficient.

        Type

           bool

fit_p1

    Enable optimization of p1 tangential distortion coefficient.

        Type

           bool

fit_p2

    Enable optimization of p2 tangential distortion coefficient.

        Type

           bool

gpu_support

    GPU support flag.

        Type

           bool

name

    Task name.

        Type

           str

> **target**
>> Task target.
>>> **Type**

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

description

Dataset description.

> **Type**
>> str

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

> **Type**
>> bool

hostname

Service hostname (4DMapper service).

> **Type**
>> str

image_compression

Image compression parameters.

> **Type**
>> *Metashape.ImageCompression*

is_draft

Mark dataset as draft (Sketchfab service).

> **Type**
>> bool

is_private

Set dataset access to private (Pointbox and Sketchfab services).

> **Type**
>> bool

is_protected

Set dataset access to protected (Pointbox service).

> **Type**
>> bool

max_zoom_level

Maximum zoom level.

> **Type**
>> int

min_zoom_level

Minimum zoom level.

> **Type**
>> int

name

> Task name.

> > str

toNetworkTask($\big[$*objects*$\big]$)

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> > **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

token

Account token (Cesium, Mapbox, Picterra, Pointbox and Sketchfab services).
> **Type**
> > str

username

Account username (4DMapper, Melown and Pointscene services).
> **Type**
> > str

workitem_count

Work item count.
> **Type**
> > int

class ReduceOverlap

Task class containing processing parameters.

apply(*object*$\big[$*, workitem*$\big]$$\big[$*, progress*$\big]$)

Apply task to specified object.
> **Parameters**
> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> - **workitem** (`int`) – Workitem index.
> - **progress** (`Callable[[float], None]`) – Progress callback.

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

> **Type**
> bool

name

Task name.

> **Type**
> str

overlap

Target number of cameras observing each point of the surface.

> **Type**
> int

target

Task target.

> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.

> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

use_selection

Focus on model selection.

> **Type**
> bool

workitem_count

Work item count.

> **Type**
> int

class RefineModel

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.

> **Parameters**
> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> - **workitem** (`int`) – Workitem index.
> - **progress** (`Callable[[float], None]`) – Progress callback.

cameras

List of cameras to process.

> **Type**
> list[int]

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

downscale

Refinement quality (1 - Ultra high, 2 - High, 4 - Medium, 8 - Low, 16 - Lowest).

> **Type**
> int

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

> **Type**
> bool

iterations

Number of refinement iterations.

> **Type**
> int

name

Task name.

> **Type**
> str

smoothness

Smoothing strength. Should be in range [0, 1].

> **Type**
> float

target

Task target.

> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.

> **Parameters**
> **objects** (`Metashape.Document` / `Metashape.Chunk` / *list[*`Metashape.Chunk`*]*) – Objects to be processed.

workitem_count

Work item count.

> **Type**
> int

class `RemoveLighting`

Task class containing processing parameters.

`ambient_occlusion_multiplier`

Ambient occlusion multiplier. Should be in range [0.25, 4].

> **Type**
> float

`ambient_occlusion_path`

Path to ambient occlusion texture atlas. Can be empty.

> **Type**
> str

`apply`(*object*[, *workitem*][, *progress*])

Apply task to specified object.

> **Parameters**
> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> - **workitem** (`int`) – Workitem index.
> - **progress** (`Callable[[float], None]`) – Progress callback.

`color_mode`

Enable multi-color processing mode.

> **Type**
> bool

`decode`(*dict*)

Initialize task parameters with a dictionary.

`decodeJSON`(*json*)

Initialize task parameters from a JSON string.

`encode`()

Create a dictionary with task parameters.

`encodeJSON`()

Create a JSON string with task parameters.

`gpu_support`

GPU support flag.

> **Type**
> bool

`internal_blur`

Internal blur. Should be in range [0, 4].

> **Type**
> float

`mesh_noise_suppression`

Mesh normals noise suppression strength. Should be in range [0, 4].

> **Type**
> float

`name`

Task name.

> **Type**
> str

target

   Task target.
      Type
         Metashape.Tasks.TargetType

toNetworkTask($\big[$*objects*$\big]$)

   Convert task to `Metashape.NetworkTask` to be applied to specified objects.
      Parameters
         objects (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.`
         `Chunk]`) – Objects to be processed.

workitem_count

   Work item count.
      Type
         int

class RenderDepthMaps

   Task class containing processing parameters.

   apply(*object*$\big[$, *workitem*$\big]$$\big[$, *progress*$\big]$)

      Apply task to specified object.
         Parameters
            • **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object
               to be processed.
            • **workitem** (`int`) – Workitem index.
            • **progress** (`Callable[[float], None]`) – Progress callback.

   cameras

      List of cameras to process.
         Type
            list[int]

   decode(*dict*)

      Initialize task parameters with a dictionary.

   decodeJSON(*json*)

      Initialize task parameters from a JSON string.

   encode()

      Create a dictionary with task parameters.

   encodeJSON()

      Create a JSON string with task parameters.

   gpu_support

      GPU support flag.
         Type
            bool

   name

      Task name.
         Type
            str

   path_depth

      Path to depth map.

> **Type**
> > str

path_diffuse

> Path to diffuse map.
> > **Type**
> > > str

path_normals

> Path to normal map.
> > **Type**

code

Script code.
> **Type**
> > str

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.
> **Type**
> > bool

name

Task name.
> **Type**
> > str

path

Script path.
> **Type**
> > str

target

Task target.
> **Type**
> > *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> > **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

workitem_count

Work item count.
> **Type**
> > int

class SaveProject

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.
> **Parameters**
> > - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> > - **workitem** (*int*) – Workitem index.

- **progress** (`Callable[[float], None]`) – Progress callback.

archive

Override project format when using non-standard file extension.
> **Type**
> bool

chunks

List of chunks to be saved.
> **Type**
> list[int]

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.
> **Type**
> bool

name

Task name.
> **Type**
> str

path

Path to project.
> **Type**
> str

target

Task target.
> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask(*[objects]*)

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> **objects** (Metashape.Document | Metashape.Chunk | *list[*Metashape. Chunk*]*) – Objects to be processed.

version

Project version to save.
> **Type**
> str

workitem_count

Work item count.

target

Task target.
> **Type**
> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.
> **Parameters**
> **objects** (`Metashape.Document` | `Metashape.Chunk` | `list[Metashape.Chunk]`) – Objects to be processed.

workitem_count

Work item count.
> **Type**
> int

class SmoothPointCloud

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.
> **Parameters**
> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
> - **workitem** (`int`) – Workitem index.
> - **progress** (`Callable[[float], None]`) – Progress callback.

apply_to_selection

Smooth points within selection.
> **Type**
> bool

classes

List of point classes to be smoothed.
> **Type**
> list[int]

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

>> *Metashape.OrthoProjection*

region

Region to be processed.

> **Type**
>> *Metashape.BBox*

replace_asset

Replace default raster with transformed one.

> **Type**
>> bool

resolution

Output resolution in meters.

> **Type**
>> float

resolution_x

Pixel size in the X dimension in projected units.

> **Type**
>> float

resolution_y

Pixel size in the Y dimension in projected units.

> **Type**
>> float

source_data

Selects between DEM and orthomosaic.

> **Type**
>> *Metashape.DataSource*

subtract

Subtraction flag.

> **Type**
>> bool

target

Task target.

> **Type**
>> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to `Metashape.NetworkTask` to be applied to specified objects.

> **Parameters**
>> **objects** (`Metashape.Document` | `Metashape.Chunk` | *list[*`Metashape.Chunk`*]*) – Objects to be processed.

width

Raster width.

> **Type**
>> int

workitem_count

Work item count.

> **Type**
>> int

world_transform

2x3 raster-to-world transformation matrix.

> **Type**
>> *Metashape.Matrix*

class TriangulateTiePoints

Task class containing processing parameters.

apply(*object*[, *workitem*][, *progress*])

Apply task to specified object.

> **Parameters**
>> - **object** (`Metashape.Chunk` | `Metashape.Document`) – Chunk or Document object to be processed.
>> - **workitem** (`int`) – Workitem index.
>> - **progress** (`Callable[[float], None]`) – Progress callback.

decode(*dict*)

Initialize task parameters with a dictionary.

decodeJSON(*json*)

Initialize task parameters from a JSON string.

encode()

Create a dictionary with task parameters.

encodeJSON()

Create a JSON string with task parameters.

gpu_support

GPU support flag.

> **Type**
>> bool

max_error

Reprojection error threshold.

> **Type**
>> float

min_image

Minimum number of point projections.

> **Type**
>> int

name

Task name.

> **Type**
>> str

target

Task target.

> **Type**
>> *Metashape.Tasks.TargetType*

toNetworkTask([*objects*])

Convert task to *Metashape.NetworkTask* to be applied to specified objects.

> **Parameters**
> **objects** (Metashape.Document | Metashape.Chunk | *list[*Metashape.Chunk*]*) – Objects to be processed.

workitem_count

Work item count.

> **Type**
> int

createTask(*name*)

Create task object by its name.

> **Parameters**
> **name** (*str*) – Task name.

> **Returns**
> Task object.

> **Return type**
> object

class Metashape.**Thumbnail**

Thumbnail instance

copy()

Returns a copy of thumbnail.

> **Returns**
> Copy of thumbnail.

> **Return type**
> *Metashape.Thumbnail*

image()

Returns image data.

> **Returns**
> Image data.

> **Return type**
> *Metashape.Image*

load(*path*[, *layer*])

Loads thumbnail from file.

> **Parameters**
>
> - **path** (*str*) – Path to the image file to be loaded.
>
> - **layer** (*int*) – Optional layer index in case of multipage files.

setImage(*image*)

> **Parameters**
> **image** (Metashape.Image) – Image object with thumbnail data.

class Metashape.**Thumbnails**

A set of thumbnails generated for a chunk frame.

`items()`

List of items.

`keys()`

List of item keys.

`meta`

Thumbnails meta data.

> **Type**
>
> *Metashape.MetaData*

`modified`

Modified flag.

> **Type**
>
> bool

`values()`

List of item values.

class `Metashape.TiePoints`

Tie point cloud instance

class Cameras

Collection of `Metashape.TiePoints.Projections` objects indexed by corresponding cameras

class Filter

Tie point cloud filter

The following example selects all tie points from the active chunk that have reprojection error higher than defined threshold:

```
>>> chunk = Metashape.app.document.chunk # active chunk
>>> threshold = 0.5
>>> f = Metashape.TiePoints.Filter()
>>> f.init(chunk, criterion = Metashape.TiePoints.Filter.ReprojectionError)
>>> f.selectPoints(threshold)
```

class Criterion

Point filtering criterion in [ReprojectionError, ReconstructionUncertainty, ImageCount, ProjectionAccuracy]

`init`(*points*, *criterion*, *progress*)

Initialize tie points filter based on specified criterion.

> **Parameters**
> * **points** (`Metashape.TiePoints` | `Metashape.Chunk`) – Tie points to filter.
> * **criterion** (`Metashape.TiePoints.Filter.Criterion`) – Point filter criterion.
> * **progress** (`Callable[[float], None]`) – Progress callback.

`max_value`

Maximum value.

> **Type**
>
> int | float

`min_value`

Minimum value.

> > **Type**
> > int | float

removePoints(*threshold*)

> Remove points based on specified threshold.
> > **Parameters**
> > **threshold**(*float*) – Criterion threshold.

resetSelection()

> Reset previously made selection.

selectPoints(*threshold*)

> Select points based on specified threshold.
> > **Parameters**
> > **threshold**(*float*) – Criterion threshold.

values

> List of values.
> > **Type**
> > list[int] | list[float]

class Point

> 3D point in the tie point cloud

coord

> Point coordinates.
> > **Type**
> > *Metashape.Vector*

cov

> Point coordinates covariance matrix.
> > **Type**
> > *Metashape.Matrix*

selected

> Point selection flag.
> > **Type**
> > bool

track_id

> Track index.
> > **Type**
> > int

valid

> Point valid flag.
> > **Type**
> > bool

class Points

> Collection of 3D points in the tie point cloud

copy()

> Returns a copy of points buffer.
> > **Returns**
> > Copy of points buffer.

> **Return type**
> *Metashape.TiePoints.Points*

> **resize**(*count*)
> > Resize points list.
> > > **Parameters**
> > > **count** (*int*) – new point count

class Projection

> Projection of the 3D point on the photo

> **coord**
> > 2D projection coordinates.
> > > **Type**
> > > *Metashape.Vector*

> **size**
> > Point size.
> > > **Type**
> > > float

> **track_id**
> > Track index.
> > > **Type**
> > > int

class Projections

> Collection of `Metashape.TiePoints.Projection` for the camera

> **copy**()
> > Returns a copy of projections buffer.
> > > **Returns**
> > > Copy of projections buffer.
> > > **Return type**
> > > *Metashape.TiePoints.Projections*

> **resize**(*count*)
> > Resize projections list.
> > > **Parameters**
> > > **count** (*int*) – new projections count

class Track

> Track in the tie point cloud

> **color**
> > Track color.
> > > **Type**
> > > tuple[int | float, . . .]

class Tracks

> Collection of tracks in the tie point cloud

> **copy**()
> > Returns a copy of tracks buffer.
> > > **Returns**
> > > Copy of tracks buffer.

> > **Return type**
> > *Metashape.TiePoints.Tracks*

> **resize**(*count*)
> > Resize track list.
> > > **Parameters**
> > > **count** (*int*) – new track count

bands
> List of color bands.

> > **Type**
> > list[str]

cleanup([*progress*])
> Remove points with insufficient number of projections.

> > **Parameters**
> > **progress** (*Callable[[float], None]*) – Progress callback.

copy(*keypoints=True*)
> Returns a copy of the tie point cloud.

> > **Parameters**
> > **keypoints** (*bool*) – copy key points data.

> > **Returns**
> > Copy of the tie point cloud.

> > **Return type**
> > *Metashape.TiePoints*

cropSelectedPoints()
> Crop selected points.

cropSelectedTracks()
> Crop selected tie points.

data_type
> Data type used to store color values.

> > **Type**
> > *Metashape.DataType*

export(*path*, *format='obj'*[, *projection*])
> Export tie points.

> > **Parameters**
> > - **path** (*str*) – Path to output file.
> > - **format** (*str*) – Export format in ['obj', 'ply'].
> > - **projection** (Metashape.Matrix / Metashape.CoordinateSystem) – Sets output projection.

meta
> Tie points meta data.

> > **Type**
> > *Metashape.MetaData*

modified
    Modified flag.

>   **Type**
>   bool

pickPoint(*origin*, *target*, *endpoints=1*)
    Returns ray intersection with the tie point cloud (point on the ray nearest to some point).

>   **Parameters**
>
>   - **origin** (`Metashape.Vector`) – Ray origin.
>
>   - **target** (`Metashape.Vector`) – Point on the ray.
>
>   - **endpoints** (`int`) – Number of endpoints to check for (0 - line, 1 - ray, 2 - segment).
>
>   **Returns**
>   Coordinates of the intersection point.
>
>   **Return type**
>   *Metashape.Vector*

points
    List of points.

>   **Type**
>   *Metashape.TiePoints.Points*

projections
    Point projections for each photo.

>   **Type**
>   *Metashape.TiePoints.Projections*

removeKeypoints()
    Remove keypoints from tie point cloud.

removeSelectedPoints()
    Remove selected points.

removeSelectedTracks()
    Remove selected tie points.

renderDepth(*transform*, *calibration*, *point_size=1*, *cull_points=False*, *add_alpha=True*)
    Render tie points depth image for specified viewpoint.

>   **Parameters**
>
>   - **transform** (`Metashape.Matrix`) – Camera location.
>
>   - **calibration** (`Metashape.Calibration`) – Camera calibration.
>
>   - **point_size** (`int`) – Point size.
>
>   - **cull_points** (`bool`) – Enable normal based culling.
>
>   - **add_alpha** (`bool`) – Generate image with alpha channel.
>
>   **Returns**
>   Rendered image.
>
>   **Return type**
>   *Metashape.Image*

renderImage(*transform*, *calibration*, *point_size=1*, *cull_points=False*, *add_alpha=True*, *raster_transform=RasterTransformNone*)

Render tie points image for specified viewpoint.

> **Parameters**
>
> - **transform** ([Metashape.Matrix](#)) – Camera location.
> - **calibration** ([Metashape.Calibration](#)) – Camera calibration.
> - **point_size** (*int*) – Point size.
> - **cull_points** (*bool*) – Enable normal based culling.
> - **add_alpha** (*bool*) – Generate image with alpha channel.
> - **raster_transform** ([Metashape.RasterTransformType](#)) – Raster band transformation.
>
> **Returns**
> Rendered image.
>
> **Return type**
> *[Metashape.Image](#)*

renderMask(*transform*, *calibration*, *point_size=1*, *cull_points=False*)

Render tie points mask image for specified viewpoint.

> **Parameters**
>
> - **transform** ([Metashape.Matrix](#)) – Camera location.
> - **calibration** ([Metashape.Calibration](#)) – Camera calibration.
> - **point_size** (*int*) – Point size.
> - **cull_points** (*bool*) – Enable normal based culling.
>
> **Returns**
> Rendered image.
>
> **Return type**
> *[Metashape.Image](#)*

renderNormalMap(*transform*, *calibration*, *point_size=1*, *cull_points=False*, *add_alpha=True*)

Render image with tie points normals for specified viewpoint.

> **Parameters**
>
> - **transform** ([Metashape.Matrix](#)) – Camera location.
> - **calibration** ([Metashape.Calibration](#)) – Camera calibration.
> - **point_size** (*int*) – Point size.
> - **cull_points** (*bool*) – Enable normal based culling.
> - **add_alpha** (*bool*) – Generate image with alpha channel.
>
> **Returns**
> Rendered image.
>
> **Return type**
> *[Metashape.Image](#)*

renderPreview(*width = 2048*, *height = 2048*[, *transform*], *point_size=1*[, *progress*])

Generate tie points preview image.

> **Parameters**
>
> - **width** (*int*) – Preview image width.
>
> - **height** (*int*) – Preview image height.
>
> - **transform** (*Metashape.Matrix*) – 4x4 viewpoint transformation matrix.
>
> - **point_size** (*int*) – Point size.
>
> - **progress** (*Callable[[float], None]*) – Progress callback.
>
> **Returns**
> Preview image.
>
> **Return type**
> *Metashape.Image*

tracks

List of tracks.

> **Type**
> *Metashape.TiePoints.Tracks*

class Metashape.**TiledModel**

Tiled model data.

class FaceCount

Tiled model face count in [LowFaceCount, MediumFaceCount, HighFaceCount]

bands

List of color bands.

> **Type**
> list[str]

clear()

Clears tiled model data.

copy()

Create a copy of the tiled model.

> **Returns**
> Copy of the tiled model.
>
> **Return type**
> *Metashape.TiledModel*

crs

Reference coordinate system.

> **Type**
> *Metashape.CoordinateSystem* | None

data_type

Data type used to store color values.

> **Type**
> *Metashape.DataType*

key

> Tiled model identifier.
>
> > **Type**
> >
> > > int

label

> Tiled model label.
>

> > **Type**
> >
> > > *[Metashape.MetaData](#)*

modified

> Modified flag.
>
> > **Type**
> >
> > > bool

pickPoint(*origin*, *target*, *endpoints=1*)

> Returns ray intersection with the tiled model.
>
> > **Parameters**
> >
> > > - **origin** ([Metashape.Vector](#)) – Ray origin.
> > >
> > > - **target** ([Metashape.Vector](#)) – Point on the ray.
> > >
> > > - **endpoints** (`int`) – Number of endpoints to check for (0 - line, 1 - ray, 2 - segment).
> >
> > **Returns**
> >
> > > Coordinates of the intersection point.
> >
> > **Return type**
> >
> > > *[Metashape.Vector](#)*

renderDepth(*transform*, *calibration*, *resolution=1*, *cull_faces=True*, *add_alpha=True*)

> Render tiled model depth image for specified viewpoint.
>
> > **Parameters**
> >
> > > - **transform** ([Metashape.Matrix](#)) – Camera location.
> > >
> > > - **calibration** ([Metashape.Calibration](#)) – Camera calibration.
> > >
> > > - **resolution** (`float`) – Level of detail resolution in screen pixels.
> > >
> > > - **cull_faces** (`bool`) – Enable back-face culling.
> > >
> > > - **add_alpha** (`bool`) – Generate image with alpha channel.
> >
> > **Returns**
> >
> > > Rendered image.
> >
> > **Return type**
> >
> > > *[Metashape.Image](#)*

renderImage(*transform*, *calibration*, *resolution=1*, *cull_faces=True*, *add_alpha=True*,
raster_transform=RasterTransformNone)

Render tiled model image for specified viewpoint.

> **Parameters**
>
> - **transform** ([Metashape.Matrix](#)) – Camera location.
>
> - **calibration** ([Metashape.Calibration](#)) – Camera calibration.
>
> - **resolution** (*float*) – Level of detail resolution in screen pixels.
>
> - **cull_faces** (*bool*) – Enable back-face culling.
>
> - **add_alpha** (*bool*) – Generate image with alpha channel.
>
> - **raster_transform** ([Metashape.RasterTransformType](#)) – Raster band transformation.
>
> **Returns**
>
> Rendered image.
>
> **Return type**
>
> *[Metashape.Image](#)*

renderMask(*transform*, *calibration*, *resolution=1*, *cull_faces=True*)

Render tiled model mask image for specified viewpoint.

> **Parameters**
>
> - **transform** ([Metashape.Matrix](#)) – Camera location.
>
> - **calibration** ([Metashape.Calibration](#)) – Camera calibration.
>
> - **resolution** (*float*) – Level of detail resolution in screen pixels.
>
> - **cull_faces** (*bool*) – Enable back-face culling.
>
> **Returns**
>
> Rendered image.
>
> **Return type**
>
> *[Metashape.Image](#)*

renderNormalMap(*transform*, *calibration*, *resolution=1*, *cull_faces=True*, *add_alpha=True*)

Render image with tiled model normals for specified viewpoint.

> **Parameters**
>
> - **transform** ([Metashape.Matrix](#)) – Camera location.
>
> - **calibration** ([Metashape.Calibration](#)) – Camera calibration.
>
> - **resolution** (*float*) – Level of detail resolution in screen pixels.
>
> - **cull_faces** (*bool*) – Enable back-face culling.
>
> - **add_alpha** (*bool*) – Generate image with alpha channel.
>
> **Returns**
>
> Rendered image.
>
> **Return type**
>
> *[Metashape.Image](#)*

renderPreview(*width = 2048*, *height = 2048*[, *transform*][, *progress*])

> Generate tiled model preview image.

> > **Parameters**

> > > • **width** (*int*) – Preview image width.

> > > • **height** (*int*) – Preview image height.

> > > • **transform** ([Metashape.Matrix](#)) – 4x4 viewpoint transformation matrix.

> > > • **progress** (*Callable[[float], None]*) – Progress callback.

> > **Returns**
> > > Preview image.

> > **Return type**
> > > *[Metashape.Image](#)*

transform

> 4x4 tiled model transformation matrix.

> > **Type**
> > > *[Metashape.Matrix](#)*

class Metashape.**TiledModelFormat**

> Tiled model format in [TiledModelFormatNone, TiledModelFormatTLS, TiledModelFormatLOD, TiledModelFormatZIP, TiledModelFormatCesium, TiledModelFormatSLPK, TiledModelFormatOSGB, TiledModelFormatOSGT, TiledModelFormat3MX]

class Metashape.**TrajectoryFormat**

> Trajectory format in [TrajectoryFormatNone, TrajectoryFormatCSV, TrajectoryFormatSBET, TrajectoryFormatSOL, TrajectoryFormatTRJ]

class Metashape.**Utils**

> Utility functions.

createChessboardImage(*calib*, *cell_size=150*, *max_tilt=30*)

> Synthesizes photo of a chessboard.

> > **Parameters**

> > > • **calib** ([Metashape.Calibration](#)) – Camera calibration.

> > > • **cell_size** (*float*) – Chessboard cell size.

> > > • **max_tilt** (*float*) – Maximum camera tilt in degrees.

> > **Returns**
> > > Resulting image.

> > **Return type**
> > > *[Metashape.Image](#)*

createDifferenceMask(*image*, *background*, *tolerance=10*, *fit_colors=True*)

> Creates mask from a pair of images or an image and specified color.

> > **Parameters**

> > > • **image** ([Metashape.Image](#)) – Image to be masked.

> > > • **background** ([Metashape.Image](#) | *tuple[int, ...]*) – Background image or color value.

- **tolerance** (*int*) – Tolerance value.

- **fit_colors** (*bool*) – Enables white balance correction.

Returns
Resulting mask.

Return type
Metashape.Image

createMarkers(*chunk*, *projections*)
Creates markers from a list of non coded projections.

Parameters

- **chunk** (`Metashape.Chunk`) – Chunk to create markers in.

- **projections** (`list[tuple[Metashape.Camera, Metashape.Target]]`) – List of
marker projections.

detectTargets(*image*, *type=TargetCircular12bit*, *tolerance=50*, *inverted=False*, *noparity=False*[,
minimum_size][, *minimum_dist*])
Detect targets on the image.

Parameters

- **image** (`Metashape.Image`) – Image to process.

- **type** (`Metashape.TargetType`) – Type of targets.

- **tolerance** (*int*) – Detector tolerance (0 - 100).

- **inverted** (*bool*) – Detect markers on black background.

- **noparity** (*bool*) – Disable parity checking.

- **minimum_size** (*int*) – Minimum target radius in pixels to be detected (CrossTarget type
only).

- **minimum_dist** (*int*) – Minimum distance between targets in pixels (CrossTarget type
only).

Returns
List of detected targets.

Return type
list[*Metashape.Target*]

dmat2euler(*R*, *dR*, *euler_angles=EulerAnglesYPR*)
Calculate tangent euler rotation vector from tangent rotation matrix.

Parameters

- **R** (`Metashape.Matrix`) – Rotation matrix.

- **dR** (`Metashape.Matrix`) – Tangent rotation matrix.

- **euler_angles** (`Metashape.EulerAngles`) – Euler angles to use.

Returns
Tangent rotation angles in degrees.

Return type
Metashape.Vector

estimateImageQuality(*image*[, *mask*])

Estimate image sharpness.

> **Parameters**
>
> > - **image** ([`Metashape.Image`](#)) – Image to be analyzed.
> >
> > - **mask** ([`Metashape.Image`](#)) – Mask of the analyzed image region.
>
> **Returns**
> Quality metric.
>
> **Return type**
> float

euler2mat(*rotation*, *euler_angles=EulerAnglesYPR*)

Calculate camera to world rotation matrix from euler rotation angles.

> **Parameters**
>
> > - **rotation** ([`Metashape.Vector`](#)) – Rotation vector.
> >
> > - **euler_angles** ([`Metashape.EulerAngles`](#)) – Euler angles to use.
>
> **Returns**
> Rotation matrix.
>
> **Return type**
> *[Metashape.Matrix](#)*

mat2euler(*R*, *euler_angles=EulerAnglesYPR*)

Calculate euler rotation angles from camera to world rotation matrix.

> **Parameters**
>
> > - **R** ([`Metashape.Matrix`](#)) – Rotation matrix.
> >
> > - **euler_angles** ([`Metashape.EulerAngles`](#)) – Euler angles to use.
>
> **Returns**
> Rotation angles in degrees.
>
> **Return type**
> *[Metashape.Vector](#)*

mat2opk(*R*)

Calculate omega, phi, kappa from camera to world rotation matrix.

> **Parameters**
> **R** ([`Metashape.Matrix`](#)) – Rotation matrix.
>
> **Returns**
> Omega, phi, kappa angles in degrees.
>
> **Return type**
> *[Metashape.Vector](#)*

mat2ypr(*R*)

Calculate yaw, pitch, roll from camera to world rotation matrix.

> **Parameters**
> **R** ([`Metashape.Matrix`](#)) – Rotation matrix.
>
> **Returns**
> Yaw, pitch roll angles in degrees.

> **Return type**
> *Metashape.Vector*

opk2mat(*angles*)

Calculate camera to world rotation matrix from omega, phi, kappa angles.

> **Parameters**
> **angles** (`Metashape.Vector`) – Omega, phi, kappa angles in degrees.
>
> **Returns**
> Rotation matrix.
>
> **Return type**
> *Metashape.Matrix*

ypr2mat(*angles*)

Calculate camera to world rotation matrix from yaw, pitch, roll angles.

> **Parameters**
> **angles** (`Metashape.Vector`) – Yaw, pitch, roll angles in degrees.
>
> **Returns**
> Rotation matrix.
>
> **Return type**
> *Metashape.Matrix*

class `Metashape.Vector`

n-component vector

```
>>> import Metashape
>>> vect = Metashape.Vector( (1, 2, 3) )
>>> vect2 = vect.copy()
>>> vect2.size = 4
>>> vect2.w = 5
>>> vect2 *= -1.5
>>> vect.size = 4
>>> vect.normalize()
>>> Metashape.app.messageBox("Scalar product is " + str(vect2 * vect))
```

copy()

Return a copy of the vector.

> **Returns**
> A copy of the vector.
>
> **Return type**
> *Metashape.Vector*

cross(*a*, *b*)

Cross product of 2 vectors.

> **Parameters**
> - **a** (`Metashape.Vector`) – First vector.
> - **b** (`Metashape.Vector`) – Second vector.
>
> **Returns**
> Cross product.

> > **Return type**
> > > *Metashape.Vector*

> **norm()**
> > Return norm of the vector.

> **norm2()**
> > Return squared norm of the vector.

> **normalize()**
> > Normalize vector to the unit length.

> **normalized()**
> > Return a new, normalized vector.

> > > **Returns**
> > > > a normalized copy of the vector

> > > **Return type**
> > > > *Metashape.Vector*

> **size**
> > Vector dimensions.

> > > **Type**
> > > > int

> **w**
> > Vector W component.

> > > **Type**
> > > > float

> **x**
> > Vector X component.

> > > **Type**
> > > > float

> **y**
> > Vector Y component.

> > > **Type**
> > > > float

> **z**
> > Vector Z component.

> > > **Type**
> > > > float

> **zero()**
> > Set all elements to zero.

class Metashape.**Version**

> Version object contains application version numbers.

> **build**
> > Build number.

> **Type**
> > int

copy()

> Return a copy of the object.
>
> > **Returns**
> > > A copy of the object.
> >
> > **Return type**
> > > *Metashape.Version*

major

> Major version number.
>
> > **Type**
> > > int

micro

> Micro version number.
>
> > **Type**
> > > int

minor

> Minor version number.
>
> > **Type**
> > > int

class Metashape.**Viewpoint**(*app*)

> Represents viewpoint in the model view

center

> Camera center.
>
> > **Type**
> > > *Metashape.Vector*

coo

> Center of orbit.
>
> > **Type**
> > > *Metashape.Vector*

copy()

> Return a copy of the object.
>
> > **Returns**
> > > A copy of the object.
> >
> > **Return type**
> > > *Metashape.Viewpoint*

fov

> Camera vertical field of view in degrees.
>
> > **Type**
> > > float

height

>   OpenGL window height.

>   > **Type**
>   >   int

mag

>   Camera magnification defined by distance to the center of rotation.

>   > **Type**
>   >   float

rot

>   Camera rotation matrix.

>   > **Type**
>   >   *Metashape.Matrix*

width

>   OpenGL window width.

>   > **Type**
>   >   int

class Metashape.**Vignetting**

>   Vignetting polynomial

copy()

>   Return a copy of the object.

>   > **Returns**
>   >   A copy of the object.

>   > **Return type**
>   >   *Metashape.Vignetting*

PYTHON API CHANGE LOG

3.1 Metashape version 2.1.1

- Added Document.sortChunks() method

- Added Model.setVertexColors() method

- Added key attribute to CameraGroup, MarkerGroup and ScalebarGroup classes

- Added BuildTexture.anti_aliasing attribute

- Added ExportModel.gltf_y_up attribute

- Added anti_aliasing argument to Chunk.buildTexture() method

- Added gltf_y_up argument to Chunk.exportModel() method

3.2 Metashape version 2.1.0

- Added Component and ModelGroup classes

- Added TrajectoryData, LaserScansData and DepthMapsAndLaserScansData to DataSource enum

- Added PointCloudFormatCOPC to PointCloudFormat enum

- Added ModelViewElevation to ModelView.ModelViewMode enum

- Added TiePointsViewElevation to ModelView.TiePointsViewMode enum

- Added TiledModelViewElevation to ModelView.TiledModelViewMode enum

- Added Chunk.mergeComponents() and Chunk.splitComponents() methods

- Added Elevation.pickPoint() method

- Added ModelView.captureVideo() method

- Added Camera.component attribute

- Added loop and smooth attributes to CameraTrack class

- Added component, components, model_group and model_groups attributes to Chunk class

- Added crs, group and transform attributes to Model class

- Added PointCloud.component attribute

- Added replace_asset and frames attributes to BuildModel, BuildTiledModel, BuildPointCloud, BuildDem, BuildOrthomosaic, DecimateModel, FilterPointCloud, ImportRaster and TransformRaster classes

- Added split_in_blocks, blocks_crs, blocks_size, blocks_origin, clip_to_boundary, export_blocks, build_texture and output_folder attributes to BuildModel class

- Added workitem_size_cameras and max_workgroup_size attributes to BuildTexture class

- Added BuildUV.pixel_size attribute

- Added ClassifyGroundPoints.max_terrain_slope attribute

- Added ExportPointCloud.tileset_version attribute

- Added ExportRaster.asset attribute

- Added model attribute to ColorizeModel and SmoothModel classes

- Added tiled_model, tileset_version, model_group, pixel_size, tile_size and face_count attributes to ExportTiled-Model class

- Added replace_asset and frame_paths attributes to ImportModel class

- Added match_laser_scans, downscale_3d, keypoint_limit_3d and laser_scans_vertical_axis attributes to Match-Photos class

- Added classes and apply_to_selection attributes to SmoothPointCloud class

- Added ImportPointCloud.ignore_normals attribute

- Added replace_asset and frames arguments to Chunk.buildModel(), Chunk.buildTiledModel(), Chunk.buildPointCloud(), Chunk.buildDem(), Chunk.buildOrthomosaic(), Chunk.decimateModel(), Chunk.filterPointCloud(), Chunk.importRaster() and Chunk.transformRaster() methods

- Added replace_asset and frame_paths arguments to Chunk.importModel() method

- Added split_in_blocks, blocks_crs, blocks_size, blocks_origin, clip_to_boundary, export_blocks, build_texture and output_folder arguments to Chunk.buildModel() method

- Added workitem_size_cameras and max_workgroup_size arguments to Chunk.buildTexture() method

- Added pixel_size argument to Chunk.buildUV() method

- Added max_terrain_slope argument to Chunk.classifyGroundPoints() method

- Added tileset_version argument to Chunk.exportPointCloud() method

- Added asset argument to Chunk.exportRaster() method

- Added model argument to Chunk.colorizeModel() and Chunk.smoothModel() methods

- Added tiled_model, tileset_version, model_group, pixel_size, tile_size and face_count arguments to Chunk.exportTiledModel() method

- Added match_laser_scans, downscale_3d, keypoint_limit_3d and laser_scans_vertical_axis arguments to Chunk.matchPhotos() method

- Added classes and apply_to_selection arguments to Chunk.smoothPointCloud() method

- Added ignore_normals argument to Chunk.importPointCloud() method

- Added publish argument to CloudClient.uploadProject() method

- Replaced ExportTiledModel.use_rtc_center attribute with use_tileset_transform

- Replaced use_rtc_center argument in Chunk.exportTiledModel() method with use_tileset_transform

- Renamed RefineMesh class to RefineModel

- Renamed Chunk.refineMesh() method to refineModel()

- Renamed Model.transform() method to transformVertices()

- Renamed NetworkClient.serverInfo() method to serverVersion()

- Renamed NetworkClient.serverStatus() method to serverInfo()

- Renamed NetworkClient.batchStatus() method to batchInfo()

- Renamed NetworkClient.dumpBatches() method to exportBatches()

- Renamed NetworkClient.loadBatches() method to importBatches()

- Renamed NetworkClient.setBatchNodeLimit() method to setBatchWorkerLimit()

- Renamed NetworkClient.nodeList() method to workerList()

- Renamed NetworkClient.nodeStatus() method to workerInfo()

- Renamed NetworkClient.quitNode() method to quitWorker()

- Renamed NetworkClient.abortNode() method to abortWorker()

- Renamed NetworkClient.setNodeCPUEnable() method to setWorkerCpuEnabled()

- Renamed NetworkClient.setNodeCapability() method to setWorkerCapability()

- Renamed NetworkClient.setNodeGPUMask() method to setWorkerGpuMask()

- Renamed NetworkClient.setNodePaused() method to setWorkerPaused()

- Renamed NetworkClient.setNodePriority() method to setWorkerPriority()

- Renamed NetworkTask.supports_gpu attribute to gpu_support

- Renamed supports_gpu attribute to gpu_support in task classes

- Renamed DecimateModel.asset attribute to model

- Renamed TransformRaster.data_source attribute to source_data

- Renamed RenderDepthMaps.export_depth, export_diffuse and export_normals attributes to save_depth, save_diffuse and save_normals

- Renamed asset argument in Chunk.decimateModel() method to model

- Renamed data_source argument in Chunk.transformRaster() method to source_data

- Added .pyi stub file to stand-alone Python module for autocompletion in external IDEs

3.3 Metashape version 2.0.4

- Added borrowLicense() and returnLicense() methods to License class

- Added removeTextures(), removeUV(), removeVertexColors() and removeVertexConfidence() methods to Model class

- Added License.expiration attribute

- Added publish argument to CloudClient.uploadProject() method

- Added format argument to RPCModel.load() and RPCModel.save() methods

3.4 Metashape version 2.0.3

- Added SmoothPointCloud class
- Added Chunk.smoothPointCloud() method
- Added enabled and selected attributes to PointCloud class
- Added mask_dark_pixels and frame_detector attributes to DetectFiducials class
- Added mask_dark_pixels and frame_detector arguments to Chunk.detectFiducials() method

3.5 Metashape version 2.0.2

- Added PointCloudGroup class
- Added TiledModelFormat3MX to TiledModelFormat enum
- Added Chunk.addPointCloudGroup() and Chunk.findPointCloudGroup() methods
- Added Chunk.point_cloud_groups attribute
- Added PointCloud.group and PointCloud.is_laser_scan attributes

3.6 Metashape version 2.0.1

- Added License.install() method
- Added DetectFiducials.v_shape_detector attribute
- Added model and save_metadata_xml attributes to ExportModel task
- Added v_shape_detector argument to Chunk.detectFiducials() method
- Added model and save_metadata_xml arguments to Chunk.exportModel() method
- Replaced license_key argument with activation_params in License.activateOffline() method

3.7 Metashape version 2.0.0

- Added TrajectoryFormat enum
- Added DisplacementMap to Model.TextureType enum
- Added ImportTrajectory class
- Added ImportDepthImages class
- Added Chunk.importTrajectory() method
- Added Chunk.importDepthImages() method
- Added AlignCameras.point_clouds attribute
- Added ImportDepthImages.color_filenames attribute
- Added precision, is_laser_scan, replace_asset, import_images, scanner_at_origin, ignore_scanner_origin, ignore_trajectory, trajectory and frame_paths attributes to ImportPointCloud class

- Added keep_existing, return_number and point_cloud attributes to ClassifyGroundPoints class

- Added point_cloud attribute to ClassifyPoints, ColorizePointCloud, CalculatePointNormals, CompactPoint-Cloud and ExportPointCloud classes

- Added max_quantization_error attribute to DetectPowerlines class

- Added use_rtc_center attribute to ExportTiledModel class

- Added merge_assets, copy_laser_scans, copy_depth_maps, copy_point_clouds, copy_models, copy_tiled_models, copy_elevations and copy_orthomosaics attributes to MergeChunks class

- Added point_clouds argument to Chunk.alignCameras() method

- Added color_filenames argument to Chunk.importDepthImages() method

- Added precision, is_laser_scan, replace_asset, import_images, scanner_at_origin, ignore_scanner_origin, ignore_trajectory, trajectory and frame_paths arguments to Chunk.importPointCloud() method

- Added point_cloud argument to Chunk.calculatePointNormals(), Chunk.colorizePointCloud() and Chunk.exportPointCloud() methods

- Added max_quantization_error argument to Chunk.detectPowerlines() method

- Added keep_existing and return_number arguments to PointCloud.classifyGroundPoints() method

- Added use_rtc_center argument to Chunk.exportTiledModel() method

- Added merge_assets, copy_laser_scans, copy_depth_maps, copy_point_clouds, copy_models, copy_tiled_models, copy_elevations and copy_orthomosaics arguments to Document.mergeChunks() method

- Added drone_name, payload_name and payload_position arguments to CameraTrack.save() method

- Change default source_data argument value for Chunk.buildModel() and Chunk.buildTiledModel() methods to DepthMapsData

- Renamed PointsFormat enum to PointCloudFormat

- Renamed ModelView.PointCloudViewMode enum to ModelView.TiePointsViewMode

- Renamed ModelView.DenseCloudViewMode enum to ModelView.PointCloudViewMode and added PointCloudViewSolid, PointCloudViewIntensity, PointCloudViewElevation, PointCloudViewReturnNumber, PointCloudViewScanAngle, PointCloudViewSourceId enumeration values

- Renamed DataSource.PointCloudData enum value to DataSource.TiePointsData

- Renamed DataSource.DenseCloudData enum value to DataSource.PointCloudData

- Renamed PointCloud class to TiePoints

- Renamed DenseCloud class to PointCloud

- Renamed AnalyzePhotos class to AnalyzeImages

- Renamed BuildDenseCloud class to BuildPointCloud

- Renamed CalibrateLens class to CalibrateCamera

- Renamed ColorizeDenseCloud class to ColorizePointCloud

- Renamed CompactDenseCloud class to CompactPointCloud

- Renamed ExportDepth class to RenderDepthMaps

- Renamed ExportPoints class to ExportPointCloud

- Renamed FilterDenseCloud class to FilterPointCloud

- Renamed ImportPoints class to ImportPointCloud

- Renamed TriangulatePoints class to TriangulateTiePoints
- Renamed Chunk.addDenseCloud() method to addPointCloud()
- Renamed Chunk.analyzePhotos() method to analyzeImages()
- Renamed Chunk.buildDenseCloud() method to buildPointCloud()
- Renamed Chunk.colorizeDenseCloud() method to colorizePointCloud()
- Renamed Chunk.exportPoints() method to exportPointCloud()
- Renamed Chunk.filterDenseCloud() method to filterPointCloud()
- Renamed Chunk.findDenseCloud() method to findPointCloud()
- Renamed Chunk.importPoints() method to importPointCloud()
- Renamed Chunk.thinPointCloud() method to thinTiePoints()
- Renamed Chunk.triangulatePoints() method to triangulateTiePoints()
- Renamed Chunk.point_cloud attribute to tie_points
- Renamed Chunk.dense_cloud attribute to point_cloud
- Renamed Chunk.dense_clouds attribute to point_clouds
- Renamed ModelView.point_cloud_view_mode attribute to tie_points_view_mode
- Renamed ModelView.dense_cloud_view_mode attribute to point_cloud_view_mode
- Renamed AddFrames.copy_dense_cloud attribute to copy_point_cloud
- Renamed DuplicateChunk.copy_dense_clouds attribute to copy_point_clouds
- Renamed FilterPointCloud.asset attribute to point_cloud
- Renamed PublishData.save_point_colors attribute to save_point_color
- Renamed copy_dense_cloud argument in Chunk.addFrames() method to copy_point_cloud
- Renamed save_point_colors argument in Chunk.publishData() method to save_point_color
- Renamed asset argument in Chunk.filterPointCloud() method to point_cloud
- Renamed source argument in PointCloud.classifyGroundPoints() method to source_class
- Revised parameter names for point attributes in ExportPointCloud class and Chunk.exportPointCloud() methods
- Removed ImportLaserScans class
- Removed Chunk.importLaserScans() method
- Removed Chunk.samplePoints() method
- Removed use_trajectory, traj_path, traj_columns, traj_delimiter and traj_skip_rows attributes from ImportPoint-Cloud class
- Removed use_trajectory, traj_path, traj_columns, traj_delimiter and traj_skip_rows arguments from Chunk.importPointCloud() method
- Removed merge_depth_maps, merge_dense_clouds, merge_models, merge_elevations and merge_orthomosaics attributes from MergeChunks class
- Removed merge_depth_maps, merge_dense_clouds, merge_models, merge_elevations and merge_orthomosaics arguments from Document.mergeChunks() method

3.8 Metashape version 1.8.5

- Added DetectPowerlines class
- Added Chunk.detectPowerlines() method
- Added CameraTrack.interpolate() method
- Added generic_detector, right_angle_detector, fiducials_position_corners and fiducials_position_sides attributes to DetectFiducials class
- Added archive attribute to LoadProject and SaveProject classes
- Added generic_detector, right_angle_detector, fiducials_position_corners and fiducials_position_sides arguments to Chunk.detectFiducials() method
- Added archive argument to Document.open() and Document.save() methods

3.9 Metashape version 1.8.4

- Added Shutter.Model enum
- Added ImageFormatBZ2, ImageFormatASCII and ImageFormatKTX to ImageFormat enum
- Added Shape.areaFitted() method
- Added ExportPoints.folder_depth and ExportTiledModel.folder_depth attributes
- Added ImportLaserScans.multiplane attribute
- Added folder_depth argument to Chunk.exportPoints() and Chunk.exportTiledModel() methods
- Added multiplane argument to Chunk.importLaserScans() method
- Changed type of Sensor.rolling_shutter attribute to Shutter.Model
- Fixed Antenna.location and Antenna.rotation attributes to return non-None values

3.10 Metashape version 1.8.3

- Added CloudClient class
- Added PublishData class
- Added CalibrationFormatSTMap to CalibrationFormat enum
- Reorganized arguments of Chunk.publishData() method

3.11 Metashape version 1.8.2

No Python API changes

3.12 Metashape version 1.8.1

- Added CamerasFormatMA to CamerasFormat enum

- Added global_profile attribute to ExportRaster class

- Added traj_columns, traj_delimiter, traj_path, traj_skip_rows and use_trajectory attributes to ImportPoints class

- Added global_profile argument to Chunk.exportRaster() method

- Added use_trajectory, traj_path, traj_columns, traj_delimiter and traj_skip_rows arguments to Chunk.importPoints() method

- Removed fix_pixel_aspect, fix_principal_point, and remove_distortions attributes from ConvertImages class

3.13 Metashape version 1.8.0

- Added BuildPanorama and CalculatePointNormals classes

- Added ImageFormatJXL to ImageFormat enum

- Added Cylindrical to Sensor.Type enum

- Added Chunk.buildPanorama(), Chunk.calculatePointNormals() and Chunk.filterDenseCloud() methods

- Added findCamera(), findCameraGroup(), findCameraTrack(), findDenseCloud(), findDepthMaps(), findElevation(), findMarker(), findMarkerGroup(), findModel(), findOrthomosaic(), findScalebar(), findScalebarGroup(), findSensor() and findTiledModel() methods to Chunk class

- Added NetworkClient.serverStatus() method

- Added NetworkClient.setBatchPaused() and NetworkClient.setNodePaused() methods

- Added Settings.project_absolute_paths and Settings.project_compression attributes

- Added CloseHoles.apply_to_selection attribute

- Added ConvertImages.merge_planes attribute

- Added ExportPoints.screen_space_error and ExportTiledModel.screen_space_error attributes

- Added ExportReport.font_size attribute

- Added ImportPoints.point_neighbors attribute

- Added home_point, interesting_zone, powerlines, restricted_zone and safety_zone attributes to PlanMission class

- Added apply_to_selection argument to Model.closeHoles() method

- Added file_format and max_waypoints arguments to CameraTrack.save() method

- Added screen_space_error argument to Chunk.exportPoints() and Chunk.exportTiledModel() methods

- Added font_size argument to Chunk.exportReport() method

- Added point_neighbors argument to Chunk.importPoints() method

- Removed Shape.Type enum

- Removed ExportPanorama class

- Removed has_z, type, vertex_ids and vertices attributes from Shape class

- Removed pauseBatch(), resumeBatch(), pauseNode() and resumeNode() methods from NetworkClient class

- Removed PlanMission.max_waypoints attribute

- Removed SaveProject.absolute_paths and SaveProject.compression attributes

- Removed compression and absolute_paths arguments from Document.save() method

- Changed default value of BuildTiledModel.face_count attribute to 20000

- Changed default value of face_count argument in Chunk.buildTiledModel() method to 20000

3.14 Metashape version 1.7.6

- Added Cylindrical to Sensor.Type enum

3.15 Metashape version 1.7.5

- Added ClassifyGroundPoints.erosion_radius attribute

- Added erosion_radius argument to DenseCloud.classifyGroundPoints() method

3.16 Metashape version 1.7.4

- Added ServiceCesium to ServiceType enum

- Added ImportLaserScans class

- Added Chunk.colorizeDenseCloud() and Chunk.colorizeModel() methods

- Added Chunk.exportTexture() and Chunk.importLaserScans() methods

- Added breakpoints and rates attributed to GeneratePrescriptionMap class

- Added SmoothModel.preserve_edges attribute

- Added breakpoints and rates arguments to Chunk.generatePrescriptionMap() method

- Added preserve_edges argument to Chunk.smoothModel method

- Renamed ClusteringMethod enum to ClassificationMethod

- Renamed cluster_count, clustering_method and boundary attributes in GeneratePrescriptionMap class

- Renamed cluster_count, clustering_method and boundary arguments in Chunk.generatePrescriptionMap() method

- Removed ServiceSputnik from ServiceType enum

- Removed min_value, max_value and grid_azimuth attributes from GeneratePrescriptionMap class

- Removed min_value, max_value and grid_azimuth arguments from Chunk.generatePrescriptionMap() method

3.17 Metashape version 1.7.3

- Added ModelFormatOSGT and ModelFormatLandXML to ModelFormat enum
- Added TiledModelFormatOSGT to TiledModelFormat enum
- Added CoordinateSystem.datumTransform() method
- Added DenseCloud.selectPointsByShapes() method
- Added Sensor.makeMaster() method
- Added Utils.dmat2euler() method
- Added Settings.lanuage attribute
- Added ShapeGroup.meta attribute
- Added Shapes.group attribute
- Added ExportPoints.compression attribute
- Added ExportTiledModel.model_compression attribute
- Added ImportModel.decode_udim attribute
- Added MatchPhotos.keypoint_limit_per_mpx attribute
- Added compression argument to Chunk.exportPoints() method
- Added model_compression argument to Chunk.exportTiledModel() method
- Added decode_udim argument to Chunk.importModel() method
- Added keypoint_limit_per_mpx argument to Chunk.matchPhotos() method
- Added uniform_sampling argument to Chunk.samplePoints() method

3.18 Metashape version 1.7.2

- Added ClusteringMethod enum
- Added PointsFormatSLPK to PointsFormat enum
- Added DuplicateAsset and GeneratePrescriptionMap classes
- Added Chunk.generatePrescriptionMap() method
- Added merge, operand_chunk, operand_frame and operand_asset attributes to BuildTiledModel class
- Added ExportReport.include_system_info attribute
- Added GenerateMasks.depth_threshold attribute
- Added merge, operand_chunk, operand_frame and operand_asset arguments to Chunk.buildTiledModel() method
- Added include_system_info argument to Chunk.exportReport() method
- Added depth_threshold argument to Chunk.generateMasks() method

3.19 Metashape version 1.7.1

- Removed LegacyMapping from MappingMode enum
- Removed ReduceOverlap.sensor attribute
- Removed sensor argument from Chunk.reduceOverlap() method

3.20 Metashape version 1.7.0

- Added Geometry and AttachedGeometry classes
- Added FrameStep enum
- Added ServiceType enum
- Added Chunk.importVideo(), Chunk.publishData() and Chunk.samplePoints() methods
- Added Shape.geometry and Shape.is_attached attributes
- Added alpha component to ShapeGroup.color attribute value
- Added ImportRaster.nodata_value and ImportRaster.has_nodata_value attributes
- Added MatchPhotos.filter_stationary_points attribute
- Added BuildOrthomosaic.ghosting_filter attribute
- Added attach_viewpoints, group_attached_viewpoints and horizontal_zigzags attributes to PlanMission class
- Added ReduceOverlap.sensor attribute
- Added dir argument to Application.getExistingDirectory(), getOpenFileName(), getOpenFileNames() and getSaveFileName() methods
- Added nodata_value and has_nodata_value arguments to Chunk.importRaster() method
- Added filter_stationary_points argument to Chunk.matchPhotos() method
- Added ghosting_filter argument to Chunk.buildOrthomosaic() method
- Added sensor argument to Chunk.reduceOverlap() method
- Renamed ImportMasks class to GenerateMasks
- Renamed MaskSource enum to MaskingMode
- Renamed Chunk.importMasks() method to Chunk.generateMasks()
- Removed ReduceOverlap.max_cameras attribute
- Removed max_cameras argument from Chunk.reduceOverlap() method

3.21 Metashape version 1.6.6

- Added Tasks.TransformRaster class
- Added ExportReference.precision attribute
- Added toNetworkTask() method to task classes
- Added Chunk.transformRaster() method
- Added precision argument to Chunk.exportReference() method

3.22 Metashape version 1.6.5

- Added Sensor.meta attribute

3.23 Metashape version 1.6.4

- Added Model.Vertex.confidence attribute
- Added ConvertImages.use_initial_calibration attribute
- Added image_orientation, save_invalid_matches and use_initial_calibration attributes to ExportCameras class
- Added ExportModel.save_confidence attribute
- Added crs and image_orientation attributes to ImportCameras class
- Added CalibrationFormatPhotomod to CalibrationFormat enum
- Added save_invalid_matches, use_initial_calibration and image_orientation arguments to Chunk.exportCameras() method
- Added save_confidence argument to Chunk.exportModel() method
- Added crs and image_orientation arguments to Chunk.importCameras() method
- Removed BuildUV.adaptive_resolution attribute
- Removed adaptive_resolution argument from Chunk.buildUV() method

3.24 Metashape version 1.6.3

- Added renderPreview() methods to DenseCloud, Model, Orthomosaic, PointCloud and TiledModel classes
- Added BuildUV.texture_size attribute
- Added DecimateModel.apply_to_selection attribute
- Added DetectFiducials.cameras, DetectFiducials.frames and DetectFiducials.generate_masks attributes
- Added ExportModel.embed_texture attribute
- Added clip_to_boundary attribute to ExportPoints, ExportModel, ExportTiledModel and ExportRaster classes
- Added RasterFormatGeoPackage to RasterFormat enum
- Added ShapesFormatGeoPackage to ShapesFormat enum

- Added source argument to Chunk.addSensor() method

- Added texture_size argument to Chunk.buildUV() method

- Added apply_to_selection argument to Chunk.decimateModel() method

- Added generate_masks, cameras and frames arguments to Chunk.detectFiducials() method

- Added embed_texture argument to Chunk.exportModel() method

- Added width, height, point_size and progress arguments to Chunk.renderPreview() method

- Added clip_to_boundary argument to Chunk.exportPoints(), Chunk.exportModel(), Chunk.exportTiledModel() and Chunk.exportRaster() methods

- Added meta argument to NetworkClient.createBatch() method

- Removed CalibrateLens.fit_p3 and CalibrateLens.fit_p4 attributes

3.25 Metashape version 1.6.2

- Added Application.ModelView and Application.OrthoView classes

- Added Application.removeMenuItem() method

- Added Model.transform() method

- Added PointCloud.cleanup() method

- Added Application.model_view and Application.ortho_view attributes

- Added BuildTexture.transfer_texture attribute

- Added PlanMission.min_pitch and PlanMission.max_pitch attributes

- Added columns, crs, delimiter, group_delimiters and skip_rows attributes to ImportShapes class

- Added CamerasFormatNVM to CamerasFormat enum

- Added PointsFormatPTX to PointsFormat enum

- Added ShapesFormatCSV to ShapesFormat enum

- Added transfer_texture argument to Chunk.buildTexture() method

- Added columns, crs, delimiter, group_delimiters and skip_rows arguments to Chunk.importShapes() method

- Moved ModelViewMode enum to ModelView class

- Renamed Application.console attribute to console_pane

- Renamed Application.captureModelView() method to ModelView.captureView()

- Renamed Application.captureOrthoView() method to OrthoView.captureView()

- Renamed Application.viewpoint attribute to ModelView.viewpoint

- Removed ReduceOverlap.capture_distance attribute

- Removed capture_distance argument from Chunk.reduceOverlap() method

- Changed default values of AlignCameras.reset_alignment and MatchPhotos.reset_matches attributes to False

- Changed default value of reset_alignment argument in Chunk.alignCameras() method to False

- Changed default value of reset_matches argument in Chunk.matchPhotos() method to False

3.26 Metashape version 1.6.1

- Added Application.releaseFreeMemory() method
- Added CoordinateSystem.towgs84 attribute
- Added Marker.enabled attribute
- Added BuildModel.subdivide_task attribute
- Added subdivide_task argument to Chunk.buildModel() method
- Changed default value of keep_depth argument in Chunk.buildModel() and Chunk.buildTiledModel() to True

3.27 Metashape version 1.6.0

- Added BBox, ImageCompression, RPCModel and Model.Texture classes
- Added Tasks.ImportTiledModel and Task.ColorizeModel classes
- Added CalibrationFormat and ReferencePreselectionMode enums
- Added Model.addTexture() and Model.remove() methods
- Added Model.getActiveTexture() and Model.setActiveTexture() methods
- Added NetworkClient.setMasterServer() method
- Added setClassesFilter(), setConfidenceFilter(), setSelectionFilter() and resetFilters() methods to DenseCloud class
- Added renderDepth(), renderImage(), renderMask() and renderNormalMap() methods to PointCloud, Dense-Cloud and TiledModel classes
- Added Chunk.renderPreview() method
- Added Utils.euler2mat() and Utils.mat2euler() methods
- Added Calibration.rpc attribute
- Added Marker.position_covariance attribute
- Added Model.textures attribute
- Added TiledModel.crs and TiledModel.transform attributes
- Added EulerAnglesPOK and EulerAnglesANK values to EulerAngles enum
- Added PointsFormatPCD to PointsFormat enum
- Added ShapesFormatGeoJSON to ShapesFormat enum
- Added RPC to Sensor.Type enum
- Added image_compression attribute to ExportOrthophotos, ExportRaster, ExportTiledModel and UndistortPhotos classes
- Added AddPhotos.load_rpc_txt attribute
- Added AlignCameras.min_image attribute
- Added BuildDenseCloud.point_confidence attribute
- Added BuildModel.vertex_confidence, BuildModel.max_workgroup_size and Build-Model.workitem_size_cameras attributes

- Added BuildTexture.source_model and BuildTexture.texture_type attributes

- Added BuildUV.adaptive_resolution attribute

- Added DecimateModel.asset attribute

- Added ExportPanorama.image_compression attribute

- Added ExportPoints.save_classes and ExportPoints.save_confidence attributes

- Added ExportTexture.texture_type attribute

- Added ExportTiledModel.crs attribute

- Added ImportCameras.image_list and ImportCameras.load_image_list attributes

- Added ImportPoints.calculate_normals attribute

- Added MatchPhotos.guided_matching and MatchPhotos.reference_preselection_mode attributes

- Added MergeChunks.merge_depth_maps, MergeChunks.merge_elevations and MergeChunks.merge_orthomosaics attributes

- Added OptimizeCameras.fit_corrections attribute

- Added TriangulatePoints.max_error and TriangulatePoints.min_image attributes

- Added endpoints argument to PointCloud.pickPoint(), DenseCloud.pickPoint(), Model.pickPoint() and Tiled-Model.pickPoint() methods

- Added compression argument to Image.save() method

- Added cull_faces and add_alpha arguments to Model.renderDepth() method

- Added cull_faces, add_alpha and raster_transform arguments to Model.renderImage() method

- Added cull_faces argument to Model.renderMask() method

- Added cull_faces and add_alpha arguments to Model.renderNormalMap() method

- Moved TiffCompression enum to ImageCompression class

- Renamed Tasks.UndistortPhotos class to Tasks.ConvertImages

- Renamed Chunk.estimateImageQuality() method to Chunk.analyzePhotos()

- Renamed Chunk.buildPoints() method to Chunk.triangulatePoints()

- Renamed Chunk.loadReference() method to Chunk.importReference()

- Renamed Chunk.saveReference() method to Chunk.exportReference()

- Renamed Chunk.refineModel() method to Chunk.refineMesh()

- Renamed network_distribute tasks attribute to subdivide_task

- Renamed AlignChunks.align_method attribute to method

- Renamed AlignChunks.match_downscale attribute to downscale

- Renamed AlignChunks.match_filter_mask attribute to filter_mask

- Renamed AlignChunks.match_mask_tiepoints attribute to mask_tiepoints

- Renamed AlignChunks.match_point_limit attribute to keypoint_limit

- Renamed AlignChunks.match_select_pairs attribute to generic_preselection

- Renamed BuildDenseCloud.store_depth attribute to keep_depth

- Renamed BuildModel.store_depth attribute to keep_depth

- Renamed BuildOrthomosaic.ortho_surface attribute to surface_data
- Renamed BuildTiledModel.store_depth attribute to keep_depth
- Renamed BuildUV.texture_count attribute to page_count
- Renamed CalibrateColors.data_source attribute to source_data
- Renamed CalibrateColors.calibrate_color_balance attribute to white_balance
- Renamed ClassifyGroundPoints.cls_from attribute to source_class
- Renamed ClassifyPoints.cls_from attribute to source_class
- Renamed ClassifyPoints.cls_to attribute to target_classes
- Renamed DecimateModel.target_face_count attribute to face_count
- Renamed DuplicateChunk.copy_dense_cloud attribute to copy_dense_clouds
- Renamed ClassifyPoints.copy_elevation attribute to copy_elevations
- Renamed ClassifyPoints.copy_model attribute to copy_models
- Renamed ClassifyPoints.copy_orthomosaic attribute to copy_orthomosaics
- Renamed ClassifyPoints.copy_tiled_model attribute to copy_tiled_models
- Renamed ExportCameras.bingo_export_geoin attribute to bingo_save_geoin
- Renamed ExportCameras.bingo_export_gps attribute to bingo_save_gps
- Renamed ExportCameras.bingo_export_image attribute to bingo_save_image
- Renamed ExportCameras.bingo_export_itera attribute to bingo_save_itera
- Renamed ExportCameras.bundler_export_list attribute to bundler_save_list
- Renamed ExportCameras.chan_order_rotate attribute to chan_rotation_order
- Renamed ExportCameras.coordinates attribute to crs
- Renamed ExportCameras.export_markers attribute to save_markers
- Renamed ExportCameras.export_points attribute to save_points
- Renamed ExportMarkers.coordinates attribute to crs
- Renamed ExportModel.coordinates attribute to crs
- Renamed ExportModel.export_alpha attribute to save_alpha
- Renamed ExportModel.export_cameras attribute to save_cameras
- Renamed ExportModel.export_colors attribute to save_colors
- Renamed ExportModel.export_comment attribute to save_comment
- Renamed ExportModel.export_markers attribute to save_markers
- Renamed ExportModel.export_normals attribute to save_normals
- Renamed ExportModel.export_texture attribute to save_texture
- Renamed ExportModel.export_udim attribute to save_udim
- Renamed ExportModel.export_uv attribute to save_uv
- Renamed ExportOrthophotos.write_alpha attribute to save_alpha
- Renamed ExportOrthophotos.write_kml attribute to save_kml

- Renamed ExportOrthophotos.write_world attribute to save_world
- Renamed ExportPoints.coordinates attribute to crs
- Renamed ExportPoints.data_source attribute to source_data
- Renamed ExportPoints.export_colors attribute to save_colors
- Renamed ExportPoints.export_comment attribute to save_comment
- Renamed ExportPoints.export_images attribute to save_images
- Renamed ExportPoints.export_normals attribute to save_normals
- Renamed ExportPoints.tile_height attribute to block_height
- Renamed ExportPoints.tile_width attribute to block_width
- Renamed ExportPoints.write_tiles attribute to split_in_blocks
- Renamed ExportRaster.data_source attribute to source_data
- Renamed ExportRaster.kmz_section_enable attribute to network_links
- Renamed ExportRaster.tile_width attribute to block_width
- Renamed ExportRaster.tile_height attribute to block_height
- Renamed ExportRaster.write_alpha attribute to save_alpha
- Renamed ExportRaster.write_kml attribute to save_kml
- Renamed ExportRaster.write_scheme attribute to save_scheme
- Renamed ExportRaster.write_tiles attribute to split_in_blocks
- Renamed ExportRaster.write_world attribute to save_world
- Renamed ExportRaster.xyz_level_min attribute to min_zoom_level
- Renamed ExportRaster.xyz_level_max attribute to max_zoom_level
- Renamed ExportShapes.coordinates attribute to crs
- Renamed ExportShapes.export_attributes attribute to save_attributes
- Renamed ExportShapes.export_labels attribute to save_labels
- Renamed ExportShapes.export_points attribute to save_points
- Renamed ExportShapes.export_polygons attribute to save_polygons
- Renamed ExportShapes.export_polylines attribute to save_polylines
- Renamed ExportTexture.write_alpha attribute to save_alpha
- Renamed ExportTiledModel.mesh_format attribute to model_format
- Renamed ImportMasks.method attribute to source
- Renamed ImportModel.coordinates attribute to crs
- Renamed ImportPoints.coordinates attribute to crs
- Renamed ImportReference.coordinates attribute to crs
- Renamed MatchPhotos.preselection_generic attribute to generic_preselection
- Renamed MatchPhotos.preselection_reference attribute to reference_preselection
- Renamed MatchPhotos.store_keypoints attribute to keep_keypoints

- Renamed RefineMesh.niterations attribute to iterations

- Renamed SmoothModel.apply_to_selected attribute to apply_to_selection

- Renamed TrackMarkers.frame_start attribute to first_frame

- Renamed TrackMarkers.frame_end attribute to last_frame

- Renamed processing methods arguments to match task parameters names (e.g. dx/dy -> resolution_x/resolution_y, write_xxx -> save_xxx, export_xxx -> save_xxx, import_xxx -> load_xxx, preselection_generic -> generic_preselection, preselection_reference -> reference_preselection, source_data -> data_source, etc.)

- Replaced Chunk.importDem() method with Chunk.importRaster() method

- Replaced Chunk.exportDem() and Chunk.exportOrthomosaic() methods with Chunk.exportRaster() method

- Removed Accuracy and Quality enums

- Removed Model.texture() and Model.setTexture() methods

- Removed ExportPoints.precision attribute

- Removed OptimizeCameras.fit_p3 and OptimizeCameras.fit_p4 attributes

- Removed PlanMission.max_cameras and PlanMission.use_cameras attributes

- Removed tiff_big, tiff_tiled and tiff_overviews attributes from ExportOrthophotos and ExportRaster classes

- Removed tiff_compression attribute from ExportOrthophotos, ExportRaster and UndistortPhotos classes

- Removed jpeg_quality attribute from ExportOrthophotos, ExportRaster, ExportTiledModel and UndistortPhotos classes

3.28 Metashape version 1.5.5

No Python API changes

3.29 Metashape version 1.5.4

- Added Tasks.FilterDenseCloud class

- Added TiledModel.FaceCount enum

- Added copy() method to Antenna, Calibration, ChunkTransform, CirTransform, CoordinateSystem, Document, MetaData, OrthoProjection, RasterTransform, Region, Shutter, Target, Version, Viewpoint and Vignetting classes

- Added CameraTrack.save() and CameraTrack.load() methods

- Added Chunk.reduceOverlap() method

- Added location_enabled and rotation_enabled attributes to Sensor.Reference class

- Added CameraTrack.chunk and CameraTrack.meta attributes

- Added BuildTiledModel.ghosting_filter and BuildTiledModel.transfer_texture attributes

- Added ExportPoints.network_distribute and ExportPoints.region attributes

- Added ExportTiledModel.jpeg_quality and ExportTiledModel.texture_format attributes

- Added prevent_intersections argument to Chunk.buildContours() method

- Added transfer_texture argument to Chunk.buildTiledModel() method

- Added region argument to Chunk.exportPoints() method

- Added texture_format and jpeg_quality arguments to Chunk.exportTiledModel() method

- Added progress argument to Chunk.importMarkers() method

- Added ImageFormatWebP to ImageFormat enum

3.30 Metashape version 1.5.3

- Added DepthMap.getCalibration() and DepthMap.setCalibration() methods

- Added NetworkClient.dumpBatches(), NetworkClient.loadBatches() and NetworkClient.setBatchNodeLimit() methods

- Added location_enabled and rotation_enabled attributes to Camera.Reference class

- Added keep_depth argument to Chunk.buildTiledModel() method

- Added uv argument to Chunk.exportModel() method

- Added level argument to DepthMap.image() and DepthMap.setImage() methods

- Changed default value of keep_depth argument in Chunk.buildDenseCloud() and Chunk.buildModel() methods to True

- Changed default value of max_neighbors argument in Chunk.buildDenseCloud() method to 100

3.31 Metashape version 1.5.2

- Added CameraTrack class

- Added Tasks.PlanMission and Tasks.ReduceOverlap classes

- Added Camera.Type enum

- Added Chunk.addCameraTrack() method

- Added Application.title attribute

- Added Camera.type attribute

- Added Chunk.camera_track and Chunk.camera_tracks attributes

- Added BuildModel.trimming_radius attribute

- Added DetectMarkers.filter_mask attribute

- Added ImportReference.shutter_lag attribute

- Added Bundler and BINGO specific attributes to ExportCameras class

- Added supports_gpu attribute to task classes

- Added x, y, w, h arguments to Image.open() method

- Added filter_mask argument to Chunk.detectMarkers() method

- Added image_list argument to Chunk.importCameras() method

- Added shutter_lag argument to Chunk.loadReference() method

- Added ImageFormatBIL, ImageFormatXYZ, ImageFormatDDS to ImageFormat enum

- Removed Tasks.PlanMotion class

- Removed Animation class

- Removed Chunk.animation attribute

- Removed smoothness attribute from Tasks.BuildModel and Tasks.BuildTiledModel classes

- Removed quality and reuse_depth arguments from Chunk.buildModel() method

- Removed downscale, filter_mode, max_neighbors, max_workgroup_size, network_distribute, reuse_depth, workitem_size_cameras from Tasks.BuildModel class

3.32 Metashape version 1.5.1

- Added License class

- Added Tasks.MergeAssets class

- Added Metashape.license attribute

- Renamed Tasks.OptimizeCoverage class to Tasks.PlanMotion

3.33 Metashape version 1.5.0

- Added Sensor.Reference class

- Added Tasks.ClassifyPoints and Tasks.OptimizeCoverage classes

- Added DataType enum

- Added Model.TextureType enum

- Added Tasks.TargetType enum

- Added Animation.Track.resize() method

- Added Chunk.findFrame() method

- Added DenseCloud.classifyPoints() method

- Added Document.findChunk() method

- Added Model.Faces.resize(), Model.Vertices.resize() and Model.TexVertices.resize() methods

- Added Tasks.createTask() method

- Added decode(), decodeJSON(), encodeJSON() methods to task classes

- Added Antenna.location_covariance and Antenna.rotation_covariance attributes

- Added Camera.calibration, Camera.location_covariance and Camera.rotation_covariance attributes

- Added Chunk.image_contrast attribute

- Added DenseCloud.bands and DenseCloud.data_type attributes

- Added Model.bands and Model.data_type attributes

- Added Elevation.palette attribute

- Added Model.Face.tex_index attribute

- Added Orthomosaic.bands and Orthomosaic.data_type attributes

- Added PointCloud.Point.cov attribute

- Added PointCloud.bands and PointCloud.data_type attributes

- Added Sensor.data_type, Sensor.film_camera, Sensor.location_covariance, Sensor.reference and Sensor.rotation_covariance attributes

- Added Sensor.fixed_params and Sensor.photo_params attributes

- Added TiledModel.bands and TiledModel.data_type attributes

- Added AlignChunks.markers and AlignChunks.match_mask_tiepoints attributes

- Added BuildOrthomosaic.refine_seamlines attribute

- Added DetectMarkers.cameras and DetectMarkers.maximum_residual attributes

- Added ExportModel.colors_rgb_8bit and ExportPoints.colors_rgb_8bit attributes

- Added ExportOrthophotos.tiff_tiled and ExportRaster.tiff_tiled attributes

- Added OptimizeCameras.tiepoint_covariance attribute

- Added BuildModel.smoothness and BuildTiledModel.smoothness attributes

- Added target and workitem_count attributes to task classes

- Added max_workgroup_size and workitem_size_tiles attributes to Tasks.BuildDem class

- Added max_workgroup_size and workitem_size_cameras attributes to Tasks.BuildDenseCloud class

- Added max_workgroup_size and workitem_size_cameras attributes to Tasks.BuildDepthMaps class

- Added max_workgroup_size and workitem_size_cameras attributes to Tasks.BuildModel class

- Added max_workgroup_size, workitem_size_cameras and workitem_size_tiles attributes to Tasks.BuildOrthomosaic class

- Added max_workgroup_size, workitem_size_cameras and face_count attributes attributes to Tasks.BuildTiledModel class

- Added max_workgroup_size, workitem_size_cameras and workitem_size_pairs attributes to Tasks.MatchPhotos class

- Added refine_seamlines argument to Chunk.buildOrthomosaic() method

- Added face_count argument to Chunk.buildTiledModel() method

- Added keypoints argument to Chunk.copy() method

- Added maximum_residual and cameras arguments to Chunk.detectMarkers() method

- Added tiff_tiled argument to Chunk.exportDem(), Chunk.exportOrthomosaic() and Chunk.exportOrthophotos() methods

- Added colors_rgb_8bit argument to Chunk.exportModel() and Chunk.exportPoints() methods

- Added tiepoint_covariance argument to Chunk.optimizeCameras() method

- Added confidence argument to DenseCloud.classifyPoints() method

- Added mask_tiepoints and markers arguments to Document.alignChunks() method

- Added ignore_lock argument to Document.open() method

- Added type argument to Model.setTexture() and Model.texture() methods

- Added workitem argument to Task.apply() method

- Added ModelFormatGLTF and ModelFormatX3D to ModelFormat enum
- Added Car and Manmade to PointClass enum
- Changed default value of filter argument in Chunk.buildDepthMaps() to MildFiltering
- Removed Tasks.BuildModel.visibility_mesh attribute

3.34 PhotoScan version 1.4.4

- Added AddPhotos.strip_extensions attribute
- Added ExportRaster.image_description attribute
- Added ExportShapes.export_attributes, ExportShapes.export_labels and ExportShapes.polygons_as_polylines attributes
- Added image_description argument to Chunk.exportDem() and Chunk.exportOrthomosaic() methods
- Added format, polygons_as_polylines, export_labels and export_attributes arguments to Chunk.exportShapes() method
- Added format argument to Chunk.importShapes() method
- Added RasterFormatTMS to RasterFormat enum

3.35 PhotoScan version 1.4.3

- Added Version class
- Added Tasks.DetectFiducials class
- Added Chunk.detectFiducials() method
- Added Sensor.calibrateFiducials() method
- Added CoordinateSystem.addGeoid() method
- Added PhotoScan.version attribute
- Added Sensor.normalize_to_float attribute
- Added minimum_dist attribute to Tasks.DetectMarkers class
- Added minimum_dist argument to Chunk.detectMarkers() and Utils.detectTargets() methods
- Added keypoints argument to PointCloud.copy() method
- Changed default value of adaptive_fitting argument in Chunk.alignCameras() to False

3.36 PhotoScan version 1.4.2

- Added Tasks.ColorizeDenseCloud class
- Added PointCloud.removeKeypoints() method
- Added CoordinateSystem.transformationMatrix() method
- Added Vector.cross() method
- Added Shapes.updateAltitudes() method
- Added log_enable, log_path, network_enable, network_host, network_path and network_port attributes to Application.Settings class
- Added covariance_matrix and covariance_params attributes to Calibration class
- Added flip_x, flip_y, flip_z attributes to Tasks.BuildDem and Tasks.BuildOrthomosaic classes
- Added max_neighbors attribute to Tasks.BuildDenseCloud, Tasks.BuildDepthMaps and Tasks.BuildModel classes
- Added jpeg_quality, tiff_compression and update_gps_tags attributes to Tasks.UndistortPhotos class
- Added copy_keypoints attribute to Tasks.DuplicateChunk class
- Added width, height and world_transform attributes to Tasks.ExportRaster class
- Added store_depth attribute to Tasks.BuildTiledModel class
- Added DenseCloud.crs and DenseCloud.transform attributes
- Added CoordinateSystem.wkt2 attribute
- Added keep_keypoints argument to Chunk.matchPhotos() method
- Added flip_x, flip_y, flip_z arguments to Chunk.buildDem() and Chunk.buildOrthomosaic() methods
- Added max_neighbors argument to Chunk.buildDenseCloud() and Chunk.buildDepthMaps() methods
- Added cull_faces argument to Chunk.buildOrthomosaic() method
- Added reuse_depth and ghosting_filter arguments to Chunk.buildTiledModel() method
- Added use_reflectance_panels and use_sun_sensor arguments to Chunk.calibrateReflectance() method
- Added width, height and world_transform arguments to Chunk.exportDem() and Chunk.exportOrthomosaic() methods
- Added filter_mask argument to Chunk.estimateImageQuality() method
- Added revision argument to NetworkClient.nodeList() method
- Added ImagesData to DataSource enum
- Added ModelFormatOSGB to ModelFormat enum
- Added TiledModelFormatOSGB to TiledModelFormat enum

3.37 PhotoScan version 1.4.1

- Added OrthoProjection.Type enum
- Added Camera.image() method
- Added Chunk.loadReflectancePanelCalibration() method
- Added PointCloud.Points.copy() and PointCloud.Points.resize() methods
- Added PointCloud.Projections.resize() method
- Added PointCloud.Tracks.copy() and PointCloud.Tracks.resize() methods
- Added OrthoProjection.matrix, OrthoProjection.radius and OrthoProjection.type attributes
- Added Tasks.AnalyzePhotos.filter_mask attribute
- Added Tasks.CalibrateReflectance.use_reflectance_panels and Tasks.CalibrateReflectance.use_sun_sensor attributes
- Added Tasks.MatchPhotos.mask_tiepoints attribute
- Added Tasks.OptimizeCameras.adaptive_fitting attribute
- Added strip_extensions argument to Chunk.addPhotos() method
- Added keep_depth argument to Chunk.buildDenseCloud() method
- Added adaptive_resolution argument to Chunk.buildUV() method
- Added alpha argument to Chunk.exportModel() method
- Added mask_tiepoints argument to Chunk.matchPhotos() method
- Added adaptive_fitting argument to Chunk.optimizeCameras() method
- Added mask argument to Utils.estimateImageQuality() method
- Added CamerasFormatABC and CamerasFormatFBX to CamerasFormat enum
- Added ImageFormatJP2 to ImageFormat enum
- Added LegacyMapping to MappingMode enum

3.38 PhotoScan version 1.4.0

- Added Tasks classes
- Added Animation, OrthoProjection, Target and Vignetting classes
- Added ShapesFormat enum
- Added Marker.Type enum
- Added Chunk.calibrateColors(), Chunk.calibrateReflectance() and Chunk.locateReflectancePanels() methods
- Added Chunk.buildDepthMaps(), Chunk.importPoints(), Chunk.refineModel() and Chunk.removeLighting() methods
- Added Chunk.addDenseCloud(), Chunk.addDepthMaps(), Chunk.addElevation(), Chunk.addModel(), Chunk.addOrthomosaic() and Chunk.addTiledModel() methods
- Added Chunk.sortCameras(), Chunk.sortMarkers() and Chunk.sortScalebars() methods
- Added DenseCloud.clear() method

- Added DepthMaps.clear() and DepthMaps.copy() methods

- Added Elevation.clear() and Elevation.copy() methods

- Added Model.clear() method

- Added Orthomosaic.clear() and Orthomosaic.copy() methods

- Added TiledModel.clear() and TiledModel.copy() methods

- Added Image.gaussianBlur() and Image.uniformNoise() methods

- Added NetworkTask.encode() method

- Added Utils.createChessboardImage() and Utils.detectTargets() methods

- Added Camera.Reference.location_accuracy and Camera.Reference.rotation_accuracy attributes

- Added Camera.layer_index, Camera.master and Camera.vignetting attributes

- Added Chunk.dense_clouds, Chunk.depth_maps_sets, Chunk.elevations, Chunk.models, Chunk.orthomosaics and Chunk.tiled_models attributes

- Added Chunk.animation, Chunk.camera_crs, Chunk.marker_crs and Chunk.world_crs attributes

- Added CoordinateSystem.geoccs and CoordinateSystem.geoid_height attributes

- Added Marker.Projection.valid attribute

- Added Sensor.black_level, Sensor.fiducials, Sensor.fixed_calibration, Sensor.fixed_location, Sensor.fixed_rotation, Sensor.layer_index, Sensor.location, Sensor.master, Sensor.normalize_sensitivity, Sensor.rolling_shutter, Sensor.rotation, Sensor.sensitivity and Sensor.vignetting attributes

- Added Camera.chunk, Marker.chunk, Scalebar.chunk and Sensor.chunk attributes

- Added Marker.sensor and Marker.type attributes

- Added Elevation.projection, Orthomosaic.projection and Shapes.projection attributes

- Added DenseCloud.key and DenseCloud.label attributes

- Added DepthMaps.key and DepthMaps.label attributes

- Added Elevation.key and Elevation.label attributes

- Added Model.key and Model.label attributes

- Added Orthomosaic.key and Orthomosaic.label attributes

- Added TiledModel.key and TiledModel.label attributes

- Added point_colors argument to Chunk.buildDenseCloud() method

- Added ghosting_filter argument to Chunk.buildTexture() method

- Added minimum_size argument to Chunk.detectMarkers() method

- Added raster_transform argument to Chunk.exportModel(), Chunk.exportPoints(), Chunk.exportTiledModel() methods

- Added tiff_overviews argument to Chunk.exportDem(), Chunk.exportOrthomosaic() and Chunk.exportOrthophotos() methods

- Added min_zoom_level and max_zoom_level arguments to Chunk.exportDem() and Chunk.exportOrthomosaic() methods

- Added cameras argument to Chunk.exportOrthophotos() method

- Added image_format argument to Chunk.exportPoints() method

- Added page_numbers argument to Chunk.exportReport() method
- Added items, crs, ignore_labels, threshold and progress arguments to Chunk.loadReference() method
- Added create_markers argument to Chunk.loadReference() method
- Added progress argument to Chunk.saveReference() method
- Added quality, volumetric_masks, keep_depth and reuse_depth arguments to Chunk.buildModel() method
- Added selected_faces and fix_borders arguments to Chunk.smoothModel() method
- Added export_points, export_markers, use_labels and progress arguments to Chunk.exportCameras() method
- Added channels and datatype arguments to Photo.image() method
- Added CamerasFormatBlocksExchange and CamerasFormatORIMA to CamerasFormat enum
- Added ImageFormatNone to ImageFormat enum
- Added UndefinedLayout to ImageLayout enum
- Added ModelFormatNone and ModelFormatABC to ModelFormat enum
- Added PointsFormatNone and PointsFormatCesium to PointsFormat enum
- Added RasterFormatNone to RasterFormat enum
- Added ReferenceFormatNone and ReferenceFormatAPM to ReferenceFormat enum
- Added TiledModelFormatNone, TiledModelFormatCesium and TiledModelFormatSLPK to TiledModelFormat enum
- Renamed Chunk.master_channel attribute to Chunk.primary_channel
- Removed MatchesFormat enum
- Removed Chunk.exportMatches() method
- Removed Camera.Reference.accuracy_ypr attribute
- Removed quality, filter, cameras, keep_depth, reuse_depth arguments from Chunk.buildDenseCloud() method
- Removed color_correction argument from Chunk.buildOrthomosaic() and Chunk.buildTexture() methods
- Removed fit_shutter argument from Chunk.optimizeCameras() method

3.39 PhotoScan version 1.3.5

No Python API changes

3.40 PhotoScan version 1.3.4

No Python API changes

3.41 PhotoScan version 1.3.3

- Added network_links argument to Chunk.exportDem() and Chunk.exportOrthomosaic() methods
- Added read_only argument to Document.open() method
- Added NetworkClient.setNodeCPUEnable() and NetworkClient.setNodeGPUMask() methods
- Added Chunk.modified, DenseCloud.modified, DepthMaps.modified, Document.modified, Elevation.modified, Masks.modified, Model.modified, Orthomosaic.modified, PointCloud.modified, Shapes.modified, Thumbnails.modified, TiledModel.modified attributes
- Added Document.read_only attribute
- Added CamerasFormatSummit to CamerasFormat enum

3.42 PhotoScan version 1.3.2

- Added vertex_colors argument to Chunk.buildModel() method
- Added Shape.vertex_ids attribute

3.43 PhotoScan version 1.3.1

- Added Settings and TiledModel classes
- Added Application.getBool() method
- Added Camera.unproject() method
- Added Chunk.addFrames(), Chunk.addMarkerGroup(), Chunk.addScalebarGroup() and Chunk.buildSeamlines() methods
- Added DenseCloud.pickPoint() and DenseCloud.updateStatistics() methods
- Added Elevation.altitude() method
- Added Matrix.svd() method
- Added Model.pickPoint() method
- Added Orthomosaic.reset() and Orthomosaic.update() methods
- Added PointCloud.pickPoint() method
- Added filter argument to Application.getOpenFileName(), Application.getOpenFileNames() and Application.getSaveFileName() methods
- Added point and visibility arguments to Chunk.addMarker() method
- Added raster_transform and write_scheme arguments to Chunk.exportDem() method
- Added write_scheme and white_background arguments to Chunk.exportOrthomosaic() method
- Added white_background argument to Chunk.exportOrthophotos() method
- Added projection argument to Chunk.exportMarkers() method
- Added markers argument to Chunk.exportModel() method
- Added pairs argument to Chunk.matchPhotos() method

- Added columns and delimiter arguments to Chunk.saveReference() method

- Added version argument to Document.save() method

- Renamed npasses argument in Chunk.smoothModel() method to strength and changed its type to float

- Renamed from and to arguments in CoordinateSystem.transform(), DenseCloud.assignClass(), Dense-Cloud.assignClassToSelection() and DenseCloud.classifyGroundPoints() methods to avoid collision with re-served words

- Added Application.settings attribute

- Added Chunk.tiled_model attribute

- Added ShapeGroup.color and ShapeGroup.show_labels attributes

- Added ImageFormatTGA to ImageFormat enum

3.44 PhotoScan version 1.3.0

- Added MarkerGroup, Masks, ScalebarGroup, Shutter and Thumbnails classes

- Added Application.PhotosPane class

- Added Model.Statistics class

- Added Orthomosaic.Patch and Orthomosaic.Patches classes

- Added PointCloud.Filter class

- Added CamerasFormat, EulerAngles, ImageFormat, ImageLayout, MaskOperation, MaskSource, MatchesFor-mat, ModelFormat, ModelViewMode, PointClass, PointsFormat, RasterFormat, ReferenceFormat, ReferenceIt-ems, RotationOrder, TiffCompression, TiledModelFormat enums

- Added Application.captureOrthoView() method

- Added Chunk.refineMarkers() method

- Added CoordinateSystem.listBuiltinCRS() class method

- Added Matrix.translation() method

- Added Model.statistics() method

- Added NetworkClient.serverInfo(), NetworkClient.nodeStatus(), NetworkClient.setNodeCapability() and Net-workClient.quitNode() methods

- Added Photo.imageMeta() method

- Added Shape.area(), Shape.perimeter2D(), Shape.perimeter3D() and Shape.volume() methods

- Added Utils.createMarkers() method

- Added source argument to Application.captureModelView() method

- Added image_format argument to Chunk.exportDem() mehod

- Added write_alpha argument to Chunk.exportOrthophotos() method

- Added image_format and write_alpha arguments to Chunk.exportOrthomosaic() method

- Added groups, projection, shift and progress arguments to Chunk.exportShapes() method

- Added items and progress arguments to Chunk.copy() method

- Added sensor argument to Chunk.addCamera() method

- Added layout argument to Chunk.addPhotos() method

- Added jpeg_quality argument to Chunk.exportOrthomosaic() and Chunk.exportOrthophotos() methods

- Added fill_holes argument to Chunk.buildOrthomosaic() method

- Added fit_shutter argument to Chunk.optimizeCameras() method

- Added settings argument to Chunk.exportReport() method

- Added progress argument to various DenseCloud methods

- Added from argument to DenseCloud.classifyGroundPoints() method

- Added chunks and progress arguments to Document.append() method

- Added progress argument to Document.alignChunks() and Document.mergeChunks() methods

- Added revision argument to NetworkClient.batchList(), NetworkClient.batchStatus() methods

- Added Application.photos_pane attribute

- Added Camera.shutter attribute

- Added Chunk.masks and Chunk.thumbnails attributes

- Added Chunk.marker_groups and Chunk.scalebar_groups attributes

- Added Chunk.euler_angles and Chunk.scalebar_accuracy attributes

- Added CoordinateSystem.name attribute

- Added Marker.group and Scalebar.group attributes

- Added Orthomosaic.patches attribute

- Added RasterTransform.false_color attribute

- Added Sensor.bands attribute

- Added Shape.attributes attribute

- Added DepthMapsData, TiledModelData and OrthomosaicData to DataSource enum

- Added CircularTarget14bit to TargetType enum

- Renamed CameraReference class to Camera.Reference

- Renamed ConsolePane class to Application.ConsolePane

- Renamed MarkerProjection class to Marker.Projection

- Renamed MarkerProjections class to Marker.Projections

- Renamed MarkerReference class Marker.Reference

- Renamed MeshFace class to Model.Face

- Renamed MeshFaces class to Model.Faces

- Renamed MeshTexVertex class to Model.TexVertex

- Renamed MeshTexVertices class to Model.TexVertices

- Renamed MeshVertex class to Model.Vertex

- Renamed MeshVertices class to Model.Vertices

- Renamed PointCloudCameras class to PointCloud.Cameras

- Renamed PointCloudPoint class to PointCloud.Point

- Renamed PointCloudPoints class to PointCloud.Points

- Renamed PointCloudProjection class to PointCloud.Projection

- Renamed PointCloudProjections class to PointCloud.Projections

- Renamed PointCloudTrack class to PointCloud.Track

- Renamed PointCloudTracks class to PointCloud.Tracks

- Renamed ScalebarReference class to Scalebar.Reference

- Renamed ShapeVertices class to Shape.Vertices

- Renamed Application.enumOpenCLDevices() method to Application.enumGPUDevices()

- Renamed Shape.boundary attribute to Shape.boundary_type

- Renamed Chunk.accuracy_cameras to Chunk.camera_location_accuracy

- Renamed Chunk.accuracy_cameras_ypr to Chunk.camera_rotation_accuracy

- Renamed Chunk.accuracy_markers to Chunk.marker_location_accuracy

- Renamed Chunk.accuracy_projections to Chunk.marker_projection_accuracy

- Renamed Chunk.accuracy_tiepoints to Chunk.tiepoint_accuracy

- Renamed method argument in Chunk.importMasks() method to source and changed its type to MaskSource

- Replaced preselection argument with generic_preselection and reference_preselection arguments in Chunk.matchPhotos() method

- Replaced fit_cxcy argument with fit_cx and fit_cy arguments in Chunk.optimizeCameras() method

- Replaced fit_k1k2k3 argument with fit_k1, fit_k2 and fit_k3 arguments in Chunk.optimizeCameras() method

- Replaced fit_p1p2 argument with fit_p1 and fit_p2 arguments in Chunk.optimizeCameras() method

- Replaced Application.cpu_cores_inactive with Application.cpu_enable attribute

- Changed type of source_data argument in Chunk.buildContours() to DataSource

- Changed type of format argument in Chunk.importCameras() and Chunk.exportCameras() methods to CamerasFormat

- Changed type of rotation_order argument in Chunk.exportCameras() to RotationOrder

- Changed type of format argument in Chunk.exportDem() and Chunk.exportOrthomosaic() methods to RasterFormat

- Changed type of format argument in Chunk.exportMatches() method to MatchesFormat

- Changed type of texture_format argument in Chunk.exportModel() method to ImageFormat

- Changed type of format argument in Chunk.importModel() and Chunk.exportModel() methods to ModelFormat

- Changed type of format argument in Chunk.exportPoints() method to PointsFormat

- Changed type of tiff_compression argument in Chunk.exportOrthomosaic() and Chunk.exportOrthophotos() methods to TiffCompression

- Changed type of items argument in Chunk.exportShapes() method to Shape.Type

- Changed type of format argument in Chunk.exportTiledModel() method to TiledModelFormat

- Changed type of mesh_format argument in Chunk.exportTiledModel() method to ModelFormat

- Changed type of operation argument in Chunk.importMasks() method to MaskOperation

- Changed type of format argument in Chunk.loadReference() and Chunk.saveReference() methods to Reference-Format

- Changed type of items argument in Chunk.saveReference() method to ReferenceItems

- Removed return values from Camera.open(), Chunk.addPhotos(), Chunk.alignCameras(), Chunk.buildContours(), Chunk.buildDem(), Chunk.buildDenseCloud(), Chunk.buildModel(), Chunk.buildOrthomosaic(), Chunk.buildPoints(), Chunk.buildTexture(), Chunk.buildTiledModel(), Chunk.buildUV(), Chunk.decimateModel(), Chunk.detectMarkers(), Chunk.estimateImageQuality(), Chunk.exportCameras(), Chunk.exportDem(), Chunk.exportMarkers(), Chunk.exportMatches(), Chunk.exportModel(), Chunk.exportOrthomosaic(), Chunk.exportOrthophotos(), Chunk.exportPoints(), Chunk.exportReport(), Chunk.exportShapes(), Chunk.exportTiledModel(), Chunk.importCameras(), Chunk.importDem(), Chunk.importMarkers(), Chunk.importMasks(), Chunk.importModel(), Chunk.importShapes(), Chunk.loadReference(), Chunk.loadReferenceExif(), Chunk.matchPhotos(), Chunk.optimizeCameras(), Chunk.remove(), Chunk.saveReference(), Chunk.smoothModel(), Chunk.thinPointCloud(), Chunk.trackMarkers(), CirTransform.calibrate(), CoordinateSystem.init(), DenseCloud.classifyGroundPoints(), DenseCloud.compactPoints(), DenseCloud.selectMaskedPoints(), DenseCloud.selectPointsByColor(), Document.alignChunks(), Document.append(), Document.clear(), Document.mergeChunks(), Document.open(), Document.remove(), Document.save(), Mask.load(), Model.closeHoles(), Model.fixTopology(), Model.loadTexture(), Model.removeComponents(), Model.saveTexture(), Model.setTexture(), NetworkClient.abortBatch(), NetworkClient.abortNode(), NetworkClient.connect(), NetworkClient.pauseBatch(), NetworkClient.pauseNode(), NetworkClient.resumeBatch(), NetworkClient.resumeNode(), NetworkClient.setBatchPriority(), NetworkClient.setNodePriority(), Photo.open(), PointCloud.export(), RasterTransform.calibrateRange(), Thumbnail.load() methods in favor of exceptions

- Removed Chunk.exportContours() method

- Removed obsolete Matrix.diag() and Matrix.translation() class methods

- Removed unused focal_length argument from Calibration.save() method

- Modified Utils.mat2opk() and Utils.opk2mat() methods to work with camera to world rotation matrices

3.45 PhotoScan version 1.2.6

No Python API changes

3.46 PhotoScan version 1.2.5

- Added ShapeGroup and ShapeVertices classes

- Added CoordinateSystem.proj4 and CoordinateSystem.geogcs attributes

- Added Shapes.shapes and Shapes.groups attributes

- Added Shape.label, Shape.vertices, Shape.group, Shape.has_z, Shape.key and Shape.selected attributes

- Added Shapes.addGroup(), Shapes.addShape() and Shapes.remove() methods

- Added CoordinateSystem.transform() method

- Added Matrix.Diag(), Matrix.Rotation(), Matrix.Translation() and Matrix.Scale() class methods

- Added Matrix.rotation() and Matrix.scale() methods

- Added DenseCloud.restorePoints() and DenseCloud.selectPointsByColor() methods

- Added Application.captureModelView() method

- Added Mask.invert() method

- Added adaptive_fitting parameter to Chunk.alignCameras() method

- Added load_rotation and load_accuracy parameters to Chunk.loadReferenceExif() method

- Added source parameter to Chunk.buildTiledModel() method

- Added fill_holes parameter to Chunk.buildTexture() method

3.47 PhotoScan version 1.2.4

- Added NetworkClient and NetworkTask classes

- Added Calibration.f, Calibration.b1, Calibration.b2 attributes

- Added Chunk.exportMatches() method

- Added DenseCloud.compactPoints() method

- Added Orthomosaic.removeOrthophotos() method

- Added fit_b1 and fit_b2 parameters to Chunk.optimizeCameras() method

- Added tiff_big parameter to Chunk.exportOrthomosaic(), Chunk.exportDem() and Chunk.exportOrthophotos() methods

- Added classes parameter to Chunk.exportPoints() method

- Added progress parameter to processing methods

- Removed Calibration.fx, Calibration.fy, Calibration.skew attributes

3.48 PhotoScan version 1.2.3

- Added tiff_compression parameter to Chunk.exportOrthomosaic() and Chunk.exportOrthophotos() methods

3.49 PhotoScan version 1.2.2

- Added Camera.orientation attribute

- Added chunks parameter to Document.save() method

3.50 PhotoScan version 1.2.1

- Added CirTransform and RasterTransform classes

- Added Chunk.cir_transform and Chunk.raster_transform attributes

- Added Chunk.exportOrthophotos() method

- Added udim parameter to Chunk.exportModel() method

- Renamed RasterTransform enum to RasterTransformType

3.51 PhotoScan version 1.2.0

- Added Elevation and Orthomosaic classes
- Added Shape and Shapes classes
- Added Antenna class
- Added DataSource enum
- Added Camera.error() method
- Added Chunk.buildContours() and Chunk.exportContours() methods
- Added Chunk.importShapes() and Chunk.exportShapes() methods
- Added Chunk.exportMarkers() and Chunk.importMarkers() methods
- Added Chunk.importDem() method
- Added Chunk.buildDem(), Chunk.buildOrthomosaic() and Chunk.buildTiledModel() methods
- Added PointCloud.removeSelectedPoints() and PointCloud.cropSelectedPoints() methods
- Added Utils.mat2opk(), Utils.mat2ypr(), Utils.opk2mat() and Utils.ypr2mat() methods
- Added Chunk.elevation, Chunk.orthomosaic and Chunk.shapes attributes
- Added Chunk.accuracy_cameras_ypr attribute
- Added Sensor.antenna, Sensor.plane_count and Sensor.planes attributes
- Added Calibration.p3 and Calibration.p4 attributes
- Added Camera.planes attribute
- Added CameraReference.accuracy_ypr attribute
- Added CameraReference.accuracy, MarkerReference.accuracy and ScalebarReference.accuracy attributes
- Added Application.activated attribute
- Added Chunk.image_brightness attribute
- Added fit_p3 and fit_p4 parameters to Chunk.optimizeCameras() method
- Added icon parameter to Application.addMenuItem() method
- Added title and description parameters to Chunk.exportReport() method
- Added operation parameter to Chunk.importMasks() method
- Added columns, delimiter, group_delimiters, skip_rows parameters to Chunk.loadReference() method
- Added items parameter to Chunk.saveReference() method
- Renamed Chunk.exportModelTiled() to Chunk.exportTiledModel()
- Renamed Chunk.exportOrthophoto() to Chunk.exportOrthomosaic()
- Removed OrthoSurface and PointsSource enums
- Removed PointCloud.groups attribute
- Removed Chunk.camera_offset attribute

3.52 PhotoScan version 1.1.1

- Added Chunk.exportModelTiles() method
- Added noparity parameter to Chunk.detectMarkers() method
- Added blockw and blockh parameters to Chunk.exportPoints() method

3.53 PhotoScan version 1.1.0

- Added CameraOffset and ConsolePane classes
- Added CameraGroup, CameraReference, ChunkTransform, DepthMap, DepthMaps, MarkerReference, MarkerProjection, Mask, PointCloudGroups, PointCloudTrack, PointCloudTracks, ScalebarReference, Thumbnail classes
- Added Chunk.key, Sensor.key, Camera.key, Marker.key and Scalebar.key attributes
- Added Application.console attribute
- Added Application.addMenuSeparator() method
- Added Chunk.importMasks() method
- Added Chunk.addSensor(), Chunk.addCameraGroup(), Chunk.addCamera(), Chunk.addMarker(), Chunk.addScalebar() methods
- Added Chunk.addPhotos(), Chunk.addFrame() methods
- Added Chunk.master_channel and Chunk.camera_offset attributes
- Added Calibration.error() method
- Added Matrix.mulp() and Matrix.mulv() methods
- Added DenseCloud.assignClass(), DenseCloud.assignClassToSelection(), DenseCloud.removePoints() methods
- Added DenseCloud.classifyGroundPoints() and DenseCloud.selectMaskedPoints() methods
- Added Model.renderNormalMap() method
- Added DenseCloud.meta and Model.meta attributes
- Added PointCloud.tracks, PointCloud.groups attributes
- Added Image.tostring() and Image.fromstring() methods
- Added Image.channels property
- Added U16 data type support in Image class
- Added classes parameter to Chunk.buildModel() method
- Added crop_borders parameter to Chunk.exportDem() method
- Added chunk parameter to Document.addChunk() method
- Added format parameter to Calibration.save() and Calibration.load() methods
- Moved OpenCL settings into Application class
- Converted string constants to enum objects
- Removed Cameras, Chunks, DenseClouds, Frame, Frames, GroundControl, GroundControlLocations, GroundControlLocation, Markers, MarkerPositions, Models, Scalebars, Sensors classes

3.54 PhotoScan version 1.0.0

- Added DenseCloud and DenseClouds classes
- Added Chunk.exportModel() and Chunk.importModel() methods
- Added Chunk.estimateImageQuality() method
- Added Chunk.buildDenseCloud() and Chunk.smoothModel() methods
- Added Photo.thumbnail() method
- Added Image.resize() method
- Added Application.enumOpenCLDevices() method
- Added Utils.estimateImageQuality() method
- Added Camera.meta, Marker.meta, Scalebar.meta and Photo.meta attributes
- Added Chunk.dense_cloud and Chunk.dense_clouds attributes
- Added page parameter to Model.setTexture() and Model.texture() methods
- Added shortcut parameter to Application.addMenuItem() method
- Added absolute_paths parameter to Document.save() method
- Added fit_f, fit_cxcy, fit_k1k2k3 and fit_k4 parameters to Chunk.optimizePhotos() method
- Changed parameters of Chunk.buildModel() and Chunk.buildTexture() methods
- Changed parameters of Chunk.exportPoints() method
- Changed parameters of Model.save() method
- Changed return value of Chunks.add() method
- Removed Chunk.buildDepth() method
- Removed Camera.depth() and Camera.setDepth() methods
- Removed Frame.depth() and Frame.setDepth() methods
- Removed Frame.depth_calib attribute

3.55 PhotoScan version 0.9.1

- Added Sensor, Scalebar and MetaData classes
- Added Camera.sensor attribute
- Added Chunk.sensors attribute
- Added Calibration.width, Calibration.height and Calibration.k4 attributes
- Added Chunk.refineMatches() method
- Added Model.area() and Model.volume() methods
- Added Model.renderDepth(), Model.renderImage() and Model.renderMask() methods
- Added Chunk.meta and Document.meta attributes
- Added Calibration.project() and Calibration.unproject() methods
- Added Application.addMenuItem() method

- Added Model.closeHoles() and Model.fixTopology() methods

3.56 PhotoScan version 0.9.0

- Added Camera, Frame and CoordinateSystem classes
- Added Chunk.exportReport() method
- Added Chunk.trackMarkers() and Chunk.detectMarkers() methods
- Added Chunk.extractFrames() and Chunk.removeFrames() methods
- Added Chunk.matchPhotos() method
- Added Chunk.buildDepth() and Chunk.resetDepth() methods
- Added Chunk.cameras property
- Added Utils.createDifferenceMask() method
- Revised Chunk.alignPhotos() method
- Revised Chunk.buildPoints() method
- Revised Chunk.buildModel() method
- Removed Photo class (deprecated)
- Removed GeoProjection class (deprecated)
- Removed Chunk.photos property (deprecated)

3.57 PhotoScan version 0.8.5

- Added Chunk.fix_calibration property
- Added Chunk.exportCameras() method
- Added Chunk.exportPoints() method for dense/sparse point cloud export
- Added accuracy_cameras, accuracy_markers and accuracy_projections properties to the GroundControl class
- Added Image.undistort() method
- Added PointCloudPoint.selected and PointCloudPoint.valid properties
- Added GeoProjection.authority property
- Added GeoProjection.init() method
- Moved GroundControl.optimize() method to Chunk.optimize()
- Removed "fix_calibration" parameter from Chunk.alignPhotos() method
- Removed GeoProjection.epsg property

3.58 PhotoScan version 0.8.4

- Added GroundControl.optimize() method
- Command line scripting support removed

3.59 PhotoScan version 0.8.3

Initial version of PhotoScan Python API

PYTHON MODULE INDEX

m
